In industrial robots, there are two main types of joints: revolute and prismatic. The revolute joint allows for rotational movement around a fixed axis, while the prismatic joint allows for linear movement along a fixed axis.

Each joint has a specific function and is designed to meet the requirements of the robot's task. For example, a revolute joint is used for the arm's rotation, while a prismatic joint is used for the arm's extension.

There are also hybrid joints, which combine the features of both revolute and prismatic joints. These joints are used in applications where both rotational and linear movement are required. For example, a hybrid joint might be used for the arm's rotation and extension.

There are also specialized joints, which are designed for specific tasks. For example, a flexible joint might be used for applications where the robot needs to move in a non-rigid manner.

- Revolute joints: allow for rotational movement around a fixed axis.
- Prismatic joints: allow for linear movement along a fixed axis.
- Hybrid joints: combine the features of both revolute and prismatic joints.

There are also specialized joints, which are designed for specific tasks. For example, a flexible joint might be used for applications where the robot needs to move in a non-rigid manner.
