Management of Fragmented Animal and Plant Populations Richard Frankham,Jonathan D. Ballou,Katherine Ralls,Mark Eldridge,Michele R. Dudash,Charles B. Fenster,Robert C. Lacy,Paul Sunnucks,2017-07-04 One of the greatest unmet challenges in conservation biology is the genetic management of fragmented populations of threatened animal and plant species More than a million small isolated population fragments of threatened species are likely suffering inbreeding depression and loss of evolutionary potential resulting in elevated extinction risks Although these effects can often be reversed by re establishing gene flow between population fragments managers very rarely do this On the contrary genetic methods are used mainly to document genetic differentiation among populations with most studies concluding that genetically differentiated populations should be managed separately thereby isolating them yet further and dooming many to eventual extinction Many small population fragments are going extinct principally for genetic reasons Although the rapidly advancing field of molecular genetics is continually providing new tools to measure the extent of population fragmentation and its genetic consequences adequate guidance on how to use these data for effective conservation is still lacking This accessible authoritative text is aimed at senior undergraduate and graduate students interested in conservation biology conservation genetics and wildlife management It will also be of particular relevance to conservation practitioners and natural resource managers as well as a broader academic audience of conservation biologists and evolutionary ecologists

Marsupial Genetics and Genomics Paul D. Waters,Janine E. Deakin,Jennifer A. Marshall Graves,2010-08-05 Marsupials belong to the Class Mammalia sharing some features with other mammals yet they also possess many unique features It is their differences from the more traditionally studied mammals such as mice and humans that is of greatest value to comparative studies Sequencing of genomes from two distantly related marsupials the short grey tailed opossum from South

America and the Australian tammar wallaby has launched marsupials into the genomics era and accelerated the rate of progress in marsupial research. With the current worldwide concern for the plight of the endangered Tasmanian devil, marsupial genetics and genomics research is even more important than ever if this species is to be saved from extinction. This volume recounts some of the history of research in this field and highlights the most recent advances in the many different areas of marsupial genetics and genomics research.

The Action Plan for Australian Mammals 2012 Andrew Burbidge, John Woinarski, Peter Harrison, 2014-06-02. The Action Plan for Australian Mammals 2012 is the first review to assess the conservation status of all Australian mammals. It complements *The Action Plan for Australian Birds 2010* Garnett et al 2011 CSIRO Publishing and although the number of Australian mammal taxa is marginally fewer than for birds, the proportion of endemic, extinct and threatened mammal taxa is far greater. These authoritative reviews represent an important foundation for understanding the current status, fate and future of the nature of Australia. This book considers all species and subspecies of Australian mammals, including those of external territories and territorial seas. For all the mammal taxa, about 300 species and subspecies considered Extinct, Threatened, Near Threatened or Data Deficient, the size and trend of their population is presented along with information on geographic range and trend and relevant biological and ecological data. The book also presents the current conservation status of each taxon under Australian legislation, what additional information is needed for managers and the required management actions. Recovery plans where they exist are evaluated. The voluntary participation of more than 200 mammal experts has ensured that the conservation status and information are as accurate as possible and allowed considerable unpublished data to be included. All accounts include maps based on the latest data from Australian state and territory agencies, from published scientific literature and other sources. The Action Plan concludes that 29 Australian mammal species have become extinct and 63 species are threatened and require urgent conservation action. However, it also shows that where guided by sound knowledge, management capability and resourcing and longer term commitment, there have been some notable conservation success stories and the conservation status of some species has greatly improved over the past few decades. The Action Plan for Australian Mammals 2012 makes a major contribution to the conservation of a wonderful legacy that is a significant part of Australia's heritage. For such a legacy to endure, our society must be more aware of and empathetic with our distinctively Australian environment and particularly its marvellous mammal fauna. Relevant information must be readily accessible, environmental policy and law must be based on sound evidence, those with responsibility for environmental management must be aware of what priority actions they should take, the urgency for action and consequences of inaction must be clear and the opportunity for hope and success must be recognised. It is in this spirit that this account is offered.

Biodiversity and Environmental Change Emma Burns, David Lindenmayer, Andrew Lowe, Nicole Thurgate, 2014-02-06. Annotation: Long term ecological data are critical for informing long term trends in biodiversity and trends in environmental change. The Terrestrial Ecosystem Research Network (TERN) is a major initiative of

the Australian Government and one of its key areas of investment is to provide funding for a network of long term ecological research plots around Australia LTERN This book highlights some of the temporal changes in the environment and or in biodiversity that have occurred in different ecosystems ranging from tropical rainforests wet eucalypt forests and alpine regions through to rangelands and deserts Many important trends and changes are documented and they often provide new insights that were previously poorly understood or unknown These data are precisely the kinds of data so desperately needed to better quantify the temporal trajectories in the environment and biodiversity in Australia

Dawson,1995 In this the only up to date accessible and scientifically based book on Australia s principal icon internationally known kangaroo researcher Terry Dawson gets to the heart of what makes these animals special He shows how many features of their biology such as their reproductive patterns social structure and locomotor characteristics confer great advantages in their adaptations to Australia s harsh climate and demanding environment Besides covering widely the biology ecology and behaviour of the ten different types of kangaroos Professor Dawson compares European and Aboriginal cultural attitudes towards them He explores such issues as hunting habits conservation kangaroos as agricultural pests the economics of kangaroo ranching and the use of their products
