

Carburetor working principle

1. Inlet oil road

Fuel flows into float chamber of carburetor for its own weight, which communicates with atmosphere for balance tube of carburetor that guarantees pressure in float chamber is the same as atmospheric pressure. Floater goes up along with oil level, when oil level raise certain high, the floater drives needle valve to shut off inlet oil path., which may avoid that fuel overflows from carburetor. In reverse, when fuel goes down, floater drives needle valve to go down, needle valve opens, and then fuel is supplied into float chamber of carburetor.

2. Condensing oil road

When engine starts, electronic valve (electric condense valve) open, one part of fuel passes through condensing nozzle hole and goes into throat tube, for this mixed gas becomes thick and reaches flammable. After starting, electric condensing valve oil needle extends gradually until condensing path is shut off, here engine performs in economic mixture gas.

3. Idle speed

After engine starts, slowly condensing path is shut off, mixed gas becomes thin (the ratio of air to fuel becomes big), fuel flows through idle jet, then transition hole, finally is inhaled into throat tube. Other part of fuel passes through mixture ratio little hole, then is inhaled into throat tube, the thickness of this part of fuel can be adjusted through mixture ratio screw.
