Immunocytochemistry Richard W. Burry, 2009-12-08 Description In biomedical research because of a dramatic increase in productivity immunocytochemistry has emerged as a major technique The proposed book will provide the first practical guide to planning performing and evaluating immunocytochemical experiments In today s graduate education the emphasis is on doing research and not on formal class work Graduate students therefore lack the background in many essential techniques necessary to perform research in fields in which they were not trained As director of a university core microscopy facility which sees students and faculty from dozens of laboratories each year Dr Burry has surmised the vast majority of these novice microscope users need considerable help In an attempt to educate users Dr Burry has initiated immunocytochemistry seminars and workshops which serve to train people in this powerful research tool The proposed book is an outgrowth of these presentations and conversations with by now hundreds of people who have asked for help The philosophy which separates this book from other books in this field is that it is practical rather than academic In looking at other important immunocytochemistry titles the predominant orientation is academic with the author attempting to comprehensively discuss the topic For example one book with sample preparation lists ten fixatives which can be used however only two such fixatives are commonly used today In this particular title the detailed discussion of old methods might be seen as important in establishing the author as an expert By contrast the approach for Burry s book would be to discuss methods based on what works in animal research laboratories today and focus only on the most productive methods An additional distinction with this proposed book is the focus on animal research and not human pathology There is a certification program for pathology technicians which requires them to learn a set body of material based on processing human tissue for examination by a pathologist Many of the books on immunocytochemistry aim at this large pathology user base Due to historical reasons pathology laboratories process human tissues in a specific way and embed the tissue in paraffin as has been done for over a century In the last ten years the power of immunocytochemistry in clinical diagnosis has become clear and has accordingly been adapted to pathology However the extensive processing needed for paraffin sections is not needed if the tissues are from research animals Processing for animal based tissues takes about a third of the time and results in higher quality images The focus of this book is on processing these animal research tissues for immunocytochemistry Today there are no technique books which are aimed at this user base As a subject matter expert in the area of the proposed book Dr Burry will make recommendations and offer opinions Because this field is new and is

emerging there are numerous advantages of specific methods over other more generalized methods The purpose of this book is to show a novice how to do immunocytochemistry without engaging in a discussion of possible advanced methods For the advanced user there are several good books which discuss the unusual methods yet for the novice there are currently none Main Author Richard W Burry The Ohio State University United States The Outline of the Book Each chapter supplies a set of important principals and steps necessary for good immunocytochemistry The information is distilled down to include only the most important points and does not attempt to cover infrequently used procedures or reagents At the end of most chapters is a section on trouble shooting many of the common problems using the Sherlock Holmes method Each chapter also includes specific protocols which can be used The goal of each chapter is to present the reader with enough information to successfully design experiments and solve many of the problems one may encounter Using immunocytochemical protocols without the understanding of their workings is not advised as the user will need to evaluate his or her results to determine whether the results are reliable Such evaluation is extremely important for users who need reliable images which will clearly answer important scientific questions

the two techniques Molecular Biomethods Handbook John M. Walker, Ralph Rapley, 2008-11-04 Recent advances in the biosciences have led to a range of powerful new technologies particularly nucleic acid protein and cell based methodologies The most recent insights have come to affect how scientists investigate and define cellular processes at the molecular level Molecular Biomethods Handbook 2nd Edition expands upon the techniques included in the first edition providing theory outlines of practical procedures and applications for a range of techniques Part A of the book describes nucleic acid methods such as gene expression profiling microarray analysis and quantitative PCR In Part B protein and cell based methods are outlined in subjects ranging from protein engineering to high throughput screening Written by a well established panel of research scientists Molecular Biomethods Handbook 2nd Edition provides an up to date collection of methods used regularly in the authors own research programs This book will prove to be an invaluable reference for those engaged in or entering the field of molecular biology and will provide the necessary background for those interested in setting up and using the latest molecular techniques *Handbook of Sample Preparation for Scanning Electron Microscopy and X-Ray Microanalysis* Patrick Echlin, 2011-04-14 Scanning electron microscopy SEM and x ray microanalysis can produce magnified images and in situ chemical information from virtually any type of specimen The two instruments generally operate in a high vacuum and a very dry environment in order to produce the high energy beam of electrons needed for imaging and analysis With a few notable exceptions most specimens destined for study in the SEM are poor conductors and composed of beam sensitive light elements containing variable amounts of water In the SEM the imaging system depends on the specimen being sufficiently electrically conductive to ensure that the bulk of the incoming electrons go to ground The formation of the image depends on collecting the different signals that are scattered as a consequence of the high energy beam interacting with the sample Backscattered electrons and secondary electrons are generated within the primary beam sample interactive volume and are the two principal signals used to form images The backscattered electron coefficient increases with increasing atomic number of the specimen whereas the secondary electron coefficient is relatively insensitive to atomic number This fundamental difference in the two signals can have an important effect on the way samples may need to be prepared The analytical system depends on collecting the x ray photons that are generated within the sample as a consequence of interaction with the same high energy beam of primary electrons used to produce images Permeability of Biological Membranes Gaspar Banfalvi, 2016-02-10 This book deals with biological membranes focuses on permeabilization and pays particular attention to reversible permeabilization to maintain the viability and physiological conditions of the cells Selective permeability of biological membranes also known as semipermeability partial permeability or differential permeability allows molecules to diffuse pass by passive and active or by other types of transport processes mediated by proteins The first chapter of the book deals with the composition of biological membranes characterizes cellular membranes of prokaryotic eukaryotic cells membranes of cellular organelles and the function of biological membranes The second chapter provides an

overview of bilayer permeability selectivity of permeabilization and cellular transport processes Chapter 3 overviews different cell manipulations that aim to make cells permeable while maintaining not only the structural but also the functional integrity of cells The last chapter deals with applications particularly with reversible permeabilization to study macromolecular DNA RNA poly ADP ribose biosynthetic processes replication gene expression visualization of replicons intermediates of chromosome condensation genotoxic chromatin changes upon treatment with heavy metals and different types of irradiation The interdisciplinary aspects of the book contribute to the understanding of the structure of nucleic acids replicative intermediates Okazaki fragments RNA primer mechanism subphases of replication and repair synthesis replicons gene expression chromosome condensation generated a wealth of information that will attract a wide readership The natural audience engaged in DNA research including genetics cell and molecular biology chemistry biochemistry medicine pharmacy will find essential material in the book
