Immunological Synapse Current Topics In Microbiology And Immunology:

Immunological Synapse Takashi Saito, Facundo D. Batista, 2009-12-03 The proper physiological functioning of most eukaryotic cells requires their assembly into multi cellular tissues that form organized organ systems Cells of the immune system develop in bone marrow and lymphoid organs but as the cells mature they leave these organs and circulate as single cells Antigen receptors TCRs of T cells search for membrane MHC proteins that are bound to peptides derived from infectious pathogens or cellular transformations The detection of such specific peptide MHC antigens initiates T cell activation adhesion and immune effectors functions Studies of normal and transformed T cell lines and of T cells from transgenic mice led to comprehensive understanding of the molecular basis of antigen receptor recognition and signaling In spite of these remarkable genetic and biochemical advances other key physiological mechanisms that participate in sensing and decoding the immune context to induce the appropriate cellular immune responses remain unresolved TCR recognition is tightly regulated to trigger sensitive but balanced T cell responses that result in the effective elimination of the pathogens while minimizing collateral damage to the host The sensitivity of TCR recognition has to be properly tempered to prevent unintended activation by self peptide MHC complexes that cause autoimmune diseases It is likely that once the TCR is engaged by a peptide MHC and TCR signaling begins additional regulatory mechanisms involving other receptors would increase the delicacy of the response

Emerging Concepts Targeting Immune Checkpoints in Cancer and Autoimmunity Akihiko Yoshimura, 2017-11-25 This volume reviews the current state of research on immune checkpoints and offers novel concepts It discusses the two most important immune checkpoints T lymphocyte associated antigen 4 CTLA 4 and programmed cell death 1 PD 1 It shows that antagonistic antibodies against these two molecules are highly effective in the treatment of various cancers and that PD 1 and CTLA 4 have been linked to the suppression of T cell receptor signaling and co stimulatory molecules Further the volume examines other agents a number of cells receptors and signaling molecules that are also involved in the regulation of T cell activation and extends the concept of immune checkpoints to molecules and cells that negatively regulate T cell activation Playing essential roles in immune homeostasis they could offer new targets for cancer immunotherapy and for the therapy of autoimmune diseases Written by internationally respected scientists this book will appeal to basic scientists clinicians drug development researchers and advanced students alike **Visualizing Immunity** Dorian McGavern, Michael

Dustin, 2009-06-12 Researchers have used a variety of techniques over the past century to gain fundamental insights in the field of immunology and as technology has advanced so too has the ability of researchers to delve deeper into the biological mechanics of immunity The immune system is exceedingly complex and must patrol the entire body to protect us from foreign invaders This requires the immune system to be highly mobile and adaptable able to respond to diverse microbial challenges while maintaining the ability to distinguish self from a foreign invader This latter feature is of great importance because the immune system is equipped with toxic mediators and a failure in self non self discrimination can result in serious diseases Fortunately in most cases the immune system operates within the framework of its elegant design and protects us from diverse microbial challenges without initiating disease Because the immune system is not confined to a single tissue a comprehensive understanding of immunity requires that research be conducted at the molecular cellular and systems level Immune cells often find customized solutions to handling microbial insults that depend on the tissues in which the pathogen is
