Biegler, Thomas Coleman, Andrew R. Conn, Fadil N. Santosa, 2012-12-06 Many important molecular conformation problems such as protein folding are expressed as global minimization problems It is the fact that local minimization is insufficient that markedly differentiates this volume from the previous two Unfortunately global minimization problems that result from models of molecular conformation are

usually intractable. For example, simple 1 dimensional versions of distance conformation problems are NP hard. Nevertheless, there has been significant recent progress in the design of promising heuristic strategies often involving the use of high performance parallel computers for computing approximate global minimizers. The purpose of the sessions represented in this volume was to discuss the new algorithmic advances for global minimization in the context of protein folding and related molecular minimization problems. Emphasis was on practical shortcomings of current approaches, outstanding problems and questions, and the use of high performance parallel computers.

, 1997 **Solving Computationally Expensive Engineering Problems** Slawomir Koziel, Leifur Leifsson, Xin-She

Yang, 2014-10-01 Computational complexity is a serious bottleneck for the design process in virtually any engineering area. While migration from prototyping and experimental based design validation to verification using computer simulation models is inevitable and has a number of advantages, high computational costs of accurate high fidelity simulations can be a major issue that slows down the development of computer aided design methodologies, particularly those exploiting automated design improvement procedures, e.g. numerical optimization. The continuous increase of available computational resources does not always translate into shortening of the design cycle because of the growing demand for higher accuracy and necessity to simulate larger and more complex systems. Accurate simulation of a single design of a given system may be as long as several hours, days or even weeks, which often makes design automation using conventional methods impractical or even prohibitive. Additional problems include numerical noise often present in the simulation data, possible presence of multiple locally optimum designs as well as multiple conflicting objectives. In this edited book, various techniques that can alleviate solving computationally expensive engineering design problems are presented. One of the most promising approaches is the use of fast replacement models, so called surrogates, that reliably represent the expensive simulation based model of the system/device of interest, but they are much cheaper and analytically tractable. Here, a group of international experts summarize recent developments in the area and demonstrate applications in various disciplines of engineering and science. The main purpose of the work is to provide the basic concepts and formulations of the surrogate based modeling and optimization paradigm, as well as discuss relevant modeling techniques, optimization algorithms and design procedures. Therefore, this book should be useful to researchers and engineers from any discipline where computationally heavy simulations are used on a daily basis in the design process. *Computational Science and Its Applications - ICCSA 2006*

Mathematical Models for Biological Pattern

Formation Philip Maini, Hans Othmer, 2000-10-06 This 121st IMA volume entitled MATHEMATICAL MODELS FOR BIOLOGICAL PATTERN FORMATION is the first of a new series called FRONTIERS IN APPLICATION OF MATHEMATICS. The FRONTIERS volumes are motivated by IMA programs and workshops but are specially planned and written to provide an entree to and assessment of exciting new areas for the application of mathematical tools and analysis. The emphasis in FRONTIERS volumes is on surveys, exposition, and outlook to attract more mathematicians and other scientists to the study of these areas and to focus efforts on the most important issues rather than papers on the most recent research results aimed at an audience of specialists. The present volume of peer-reviewed papers grew out of the 1998-99 IMA program on Mathematics in Biology, in particular the Fall 1998 emphasis on Theoretical Problems in Developmental Biology and Immunology. During that period there were two workshops on Pattern Formation and Morphogenesis organized by Professors Murray Maini and Othmer. James Murray was one of the principal organizers for the entire year program. I am very grateful to James Murray for providing an introduction and to Philip Maini and Hans Othmer for their excellent work in planning and preparing this first FRONTIERS volume. I also take this opportunity to thank the National Science Foundation whose financial support of the IMA made the Mathematics in Biology program possible.
