Aesthetics and the Sciences of Mind Greg Currie,Matthew Kieran,Aaron Meskin,Jon Robson,2014-07-24 Through much of the twentieth century philosophical thinking about works of art design and other aesthetic products has emphasized intuitive and reflective methods often tied to the idea that philosophy's business is primarily to analyze concepts This philosophy from the armchair approach contrasts with methods used by psychologists sociologists evolutionary thinkers and others who study the making and reception of the arts empirically How far should philosophers be sensitive to the results of these studies Is their own largely a priori method basically flawed Are their views on aesthetic value interpretation imagination and the emotions of art to be rethought in the light of best science The essays in this volume seek answers to these questions many through detailed studies of problems traditionally regarded as philosophical but where empirical inquiry seems to be shedding interesting light No common view is looked for or found in this volume a number of authors argue that the current enthusiasm for scientific approaches to aesthetics is based on a misunderstanding of the philosophical enterprise and sometimes on misinterpretation of the science others suggest various ways that philosophy can and should accommodate and sometimes yield to the empirical approach The editors provide a substantial introduction which sets the scene historically and conceptually before summarizing the claims and arguments of the essays

A Theory of the Microdynamics of Occurrent Thought Herbert S. Demmin, 2015-08-13 A Theory of the Microdynamics of Occurrent Thought T2 is based on a reflective analysis of occurrent thoughts OTs in the spirit of phenomenological philosophy and proposes that such thoughts consist of a specific combination of ten or fewer micro phases possessing phenomenal contents that are so brief that most of us are unaware of their existence The theory specifies the movements of an operating I or central executive in and among these phases in the service of processing their contents by fleetingly becoming them followed by one of several transitions of attention that bring about different degrees of their objectification The relatively fixed sequences of the phases of OTs along with an operating I's immersion in and face up or face down surfacing from their phenomenal contents form a structure that carries and drives on line cognition supporting the view that they play a causal role in human information processing Two categories two forms and fifteen different types of OTs are defined based on the transitions of an operating I therein This book includes detailed illustrations of the different

types of OTs **Blind Vision** Zaira Cattaneo, Tomaso Vecchi, 2011-03-04 An investigation of the effects of blindness and other types of visual deficit on cognitive abilities Can a blind person see The very idea seems paradoxical And yet if we conceive of seeing as the ability to generate internal mental representations that may contain visual details the idea of blind vision becomes a concept subject to investigation In this book Zaira Cattaneo and Tomaso Vecchi examine the effects of blindness and other types of visual deficit on the development and functioning of the human cognitive system Drawing on behavioral and neurophysiological data Cattaneo and Vecchi analyze research on mental imagery spatial cognition and compensatory mechanisms at the sensorial cognitive and cortical levels in individuals with complete or profound visual impairment They find that our brain does not need our eyes to see Cattaneo and Vecchi address critical questions of broad importance the relationship of visual perception to imagery and working memory and the extent to which mental imagery depends on normal vision the functional and neural relationships between vision and the other senses the specific aspects of the visual experience that are crucial to cognitive development or specific cognitive mechanisms and the extraordinary plasticity of the brain as illustrated by the way that in the blind the visual cortex may be reorganized to support other perceptual or cognitive functions In the absence of vision the other senses work as functional substitutes and are often improved With *Blind Vision* Cattaneo and Vecchi take on the tyranny of the visual pointing to the importance of the other senses in cognition *Cognitive Psychology* Michael W.
