15. Aquatic habitats allow for external fertilization of eggs. Sperm and eggs can survive in seawater for some time because seawater has a solute concentration that resembles that inside the sperm and egg. As environments become more challenging (e.g., freshwater with much lower solute concentrations than those inside the sperm and eggs, and the dry terrestrial environment), the life span of sperm and unfertilized eggs outside the organism is much reduced. This means that sperm must either be deposited outside of the organism directly onto the eggs so that fertilization can take place quickly, or fertilization must take place internally. Most terrestrial organisms rely on internal fertilization.
