Demkov, Alexandra Navrotsky, 2005-07-14. This book presents materials fundamentals of novel gate dielectrics that are being introduced into semiconductor manufacturing to ensure the continuous scaling of the CMOS devices. This is a very fast evolving field of

research so we choose to focus on the basic understanding of the structure thermodynamics and electronic properties of these materials that determine their performance in device applications. Most of these materials are transition metal oxides. Ironically the d orbitals responsible for the high dielectric constant cause severe integration difficulties thus intrinsically limiting high k dielectrics. Though new in the electronics industry many of these materials are well known in the field of ceramics and we describe this unique connection. The complexity of the structure property relations in TM oxides makes the use of the state of the art first principles calculations necessary. Several chapters give a detailed description of the modern theory of polarization and heterojunction band discontinuity within the framework of the density functional theory. Experimental methods include oxide melt solution calorimetry and differential scanning calorimetry Raman scattering and other optical characterization techniques transmission electron microscopy and x ray photoelectron spectroscopy. Many of the problems encountered in the world of CMOS are also relevant for other semiconductors such as GaAs. A comprehensive review of recent developments in this field is thus also given. The book should be of interest to those actively engaged in the gate dielectric research and to graduate students in Materials Science Materials Physics Materials Chemistry and Electrical Engineering.

Characterization and Metrology for ULSI Technology: 2003 David G. Seiler, 2003-10-08. The worldwide semiconductor community faces increasingly difficult challenges as it moves into the manufacturing of chips with feature sizes approaching 100 nm and beyond. The magnitude of these challenges demands special attention from the metrology and analytical measurements community. New paradigms must be found. Adequate research and development for new metrology concepts are urgently needed. Topics include integrated circuit history challenges and overviews front end lithography interconnect and back end and critical analytical techniques. Characterization and metrology are key enablers for developing new semiconductor technology and in improving manufacturing. This book summarizes major issues and gives critical reviews of important measurement techniques that are crucial to continue the advances in semiconductor technology. It covers major aspects of process technology and most characterization techniques for silicon research including development manufacturing and diagnostics. The editors believe that this book of collected papers provides a concise and effective portrayal of industry characterization needs and the way they are being addressed by industry academia and government to continue the dramatic progress in semiconductor technology. Hopefully it will also provide a basis for stimulating advances in metrology and new ideas for research and development.
