Local Fields Serre:

Local Fields Jean-Pierre Serre, 2013-06-29 The goal of this book is to present local class field theory from the cohomological point of view following the method inaugurated by Hochschild and developed by Artin Tate This theory is about extensions primarily abelian of local $i.e.$ complete for a discrete valuation fields with finite residue field For example such fields are obtained by completing an algebraic number field that is one of the aspects of localisation The chapters are grouped in parts There are three preliminary parts the first two on the general theory of local fields the third on group cohomology Local class field theory strictly speaking does not appear until the fourth part Here is a more precise outline of the contents of these four parts The first contains basic definitions and results on discrete valuation rings Dedekind domains which are their globalisation and the completion process The prerequisite for this part is a knowledge of elementary notions of algebra and topology which may be found for instance in Bourbaki The second part is concerned with ramification phenomena different discriminant ramification groups Artin representation Just as in the first part no assumptions are made here about the residue fields It is in this setting that the norm map is studied I have expressed the results in terms of additive polynomials and of multiplicative polynomials since using the language of algebraic geometry would have led me too far astray

Modular Curves and Abelian Varieties John Cremona, 2004-02-23 This book presents lectures from a conference on Modular Curves and Abelian Varieties at the Centre de Recerca Matemàtica Bellaterra Barcelona The articles in this volume present the latest achievements in this extremely active field and will be of interest both to specialists and to students and researchers Many contributions focus on generalizations of the Shimura Taniyama conjecture to varieties such as elliptic curves and Abelian varieties of GL_2 type The book also includes several key articles in the subject that do not correspond to conference lectures

Elliptic Curves Dale Husemoller, 2013-06-29 The book divides naturally into several parts according to the level of the material the background required of the reader and the style of presentation with respect to details of proofs For example the first part to Chapter 6 is undergraduate in level the second part requires a background in Galois theory and the third some complex analysis while the last parts from Chapter 12 on are mostly at graduate level A general outline of much of the material can be found in Tate's colloquium lectures reproduced as an article in *Inventiones* 1974 The first part grew out of Tate's 1961 Haverford Philips Lectures as an attempt to write something for publication closely related to the original Tate notes which were more or less taken from the tape recording of the lectures themselves This includes parts of the Introduction and the first six chapters The aim of this part is to prove by elementary methods the Mordell theorem on the finite generation of the rational points on elliptic curves defined over the rational numbers In 1970 Tate returned to Haverford to give again in revised form the original lectures of 1961 and to extend the material so that it would be suitable for publication This led to a broader plan for the book

Pseudo-Differential Equations And Stochastics Over Non-Archimedean Fields Anatoly Kochubei, 2001-08-03 Provides comprehensive coverage of the most recent developments in the theory of non Archimedean pseudo differential equations and its application to stochastics and mathematical physics offering current methods of construction for stochastic processes in the field of p adic numbers and related structures Develops a new theory for parabolic equations

Rational Points Gerd Faltings, Gisbert Wüstholz, 2012-12-06 This book consists of the notes from the seminar Bonn Wuppertal 1983-84 on Arithmetic Geometry It contains a proof for the Mordell conjecture and may be useful as an introduction to Arakelov's point of view in diophantine geometry The third edition includes an appendix in which a detailed survey on the spectacular recent developments in

arithmetic algebraic geometry is given These beautiful new results have their roots in the material covered by this book

Galois Theory and Modular Forms Ki-ichiro Hashimoto, Katsuya Miyake, Hiroaki Nakamura, 2013-12-01 This volume is an outgrowth of the research project The Inverse Galois Problem and its Application to Number Theory which was carried out in three academic years from 1999 to 2001 with the support of the Grant in Aid for Scientific Research B 1 No 11440013 In September 2001 an international conference Galois Theory and Modular Forms was held at Tokyo Metropolitan University after some preparatory work shops and symposia in previous years The title of this book came from that of the conference and the authors were participants of those meet All of the articles here were critically refereed by experts Some of these articles give well prepared surveys on branches of research areas and many articles aim to bear the latest research results accompanied with carefully written expository introductions When we started our research project we picked up three areas to investigate under the key word Galois groups namely generic polynomials to be applied to number theory Galois coverings of algebraic curves to study new type of representations of absolute Galois groups and explicitly described Shimura varieties to understand well the Galois structures of some interesting polynomials including Brumer's sextic for the alternating group of degree 5 The topics of the articles in this volume are widely spread as a result At a first glance some readers may think this book somewhat unfocussed

Modular Forms Lloyd James Peter Kilford, 2008 This book presents a graduate student level introduction to the classical theory of modular forms and computations involving modular forms including modular functions and the theory of Hecke operators It also includes applications of modular forms to such diverse subjects as the theory of quadratic forms the proof of Fermat's last theorem and the approximation of π It provides a balanced overview of both the theoretical and computational sides of the subject allowing a variety of courses to be taught from it

The Fourier-Analytic Proof of Quadratic Reciprocity Michael C. Berg, 2011-09-30 A unique synthesis of the three existing Fourier analytic treatments of quadratic reciprocity The relative quadratic case was first settled by Hecke in 1923 then recast by Weil in 1964 into the language of unitary group representations The analytic proof of the general n th order case is still an open problem today going back to the end of Hecke's famous treatise of 1923 The Fourier Analytic Proof of Quadratic Reciprocity provides number theorists interested in analytic methods applied to reciprocity laws with a unique opportunity to explore the works of Hecke Weil and Kubota This work brings together for the first time in a single volume the three existing formulations of the Fourier analytic proof of quadratic reciprocity It shows how Weil's groundbreaking representation theoretic treatment is in fact equivalent to Hecke's classical approach then goes a step further presenting Kubota's algebraic reformulation of the Hecke Weil proof Extensive commutative diagrams for comparing the Weil and Kubota architectures are also featured The author clearly demonstrates the value of the analytic approach incorporating some of the most powerful tools of modern number theory including adèles, metaplectic groups and representations Finally he points out that the critical common factor among the three proofs is Poisson summation whose generalization may ultimately provide the resolution for Hecke's open

problem *Algebraic Patching* Moshe Jarden, 2011-01-03 Assuming only basic algebra and Galois theory the book develops the method of algebraic patching to realize finite groups and more generally to solve finite split embedding problems over fields The method succeeds over rational function fields of one variable over ample fields Among others it leads to the solution of two central results in Field Arithmetic a The absolute Galois group of a countable Hilbertian pac field is free on countably many generators b The absolute Galois group of a function field of one variable over an algebraically closed field C is free of rank equal to the cardinality of C *Elementary and Analytic Theory of Algebraic Numbers* Wladyslaw Narkiewicz, 2013-06-29 The aim of this book is to present an exposition of the theory of algebraic numbers excluding class field theory and its consequences There are many ways to develop this subject the latest trend is to neglect the classical Dedekind theory of ideals in favour of local methods However for numerical computations necessary for applications of algebraic numbers to other areas of number theory the old approach seems more suitable although its exposition is obviously longer On the other hand the local approach is more powerful for analytical purposes as demonstrated in Tate's thesis Thus the author has tried to reconcile the two approaches presenting a self contained exposition of the classical standpoint in the first four chapters and then turning to local methods In the first chapter we present the necessary tools from the theory of Dedekind domains and valuation theory including the structure of finitely generated modules over Dedekind domains In Chapters 2 3 and 4 the classical theory of algebraic numbers is developed Chapter 5 contains the fundamental notions of the theory of p -adic fields and Chapter 6 brings their applications to the study of algebraic number fields We include here Shafarevich's proof of the Kronecker Weber theorem and also the main properties of adèles and ideles **Automorphic Forms and Representations** Daniel Bump, 1998-11-28 This book takes advanced graduate students from the foundations to topics on the research frontier **The $\mathcal{K}$ -book** Charles A. Ramla Abdellatif, Valentijn Karemaker, Lejla Smajlovic, 2024-08-07 This volume contains research and expository content based on a wide variety of topics within modern number theory and arithmetic geometry Research in this volume arises from or is connected with the Women in Numbers Europe WiNE IV conference held in summer 2022 in Utrecht The Netherlands The contents of this volume are of interest to professional mathematicians graduate students and researchers working in number theory arithmetic geometry and related areas **Rational Points on Varieties** Bjorn Poonen, 2023-08-10 This book is motivated by the problem of determining the set of rational points on a variety but its true goal is to equip readers with a broad range of tools essential for current research in algebraic geometry and number theory The book is unconventional in that it provides concise accounts of many topics instead of a comprehensive account of just one this is intentionally designed to bring readers up to speed rapidly Among the topics included are Brauer groups faithfully flat descent algebraic groups torsors tale and fppf cohomology the Weil conjectures and the Brauer Manin and descent obstructions A final chapter applies all these to study the arithmetic of surfaces The down to earth explanations and the over 100 exercises make the book suitable for use as a graduate level textbook but even experts will appreciate having a single source covering many aspects of geometry over an unrestricted ground field and containing some material that cannot be found elsewhere The origins of arithmetic or Diophantine geometry can be traced back to antiquity and it remains a lively and wide research domain up to our days The book by Bjorn Poonen a leading expert in the field opens doors to this vast field for many readers with different experiences and backgrounds It leads through various algebraic geometric constructions towards its central subject obstructions to existence of rational points Yuri Manin Max Planck Institute Bonn It is clear that my mathematical life would have been very different if a book like this had been around at the time I was a student Hendrik Lenstra University Leiden Understanding rational points on arbitrary algebraic varieties is the ultimate challenge We have conjectures but few results Poonen s book with its mixture of basic constructions and openings into current research will attract new generations to the Queen of Mathematics Jean Louis Colliot Th l ne Universit Paris Sud A beautiful subject handled by a master Joseph Silverman Brown University *Perfectoid Spaces* Debargha Banerjee, Kiran S. Kedlaya, Ehud de Shalit, Chitrabhanu Chaudhuri, 2022-04-21 This book contains selected chapters on perfectoid spaces their introduction and applications as invented by Peter Scholze in his Fields Medal winning work These contributions are presented at the conference on Perfectoid Spaces held at the International Centre for Theoretical Sciences Bengaluru India from 9 20 September 2019 The

objective of the book is to give an advanced introduction to Scholze's theory and understand the relation between perfectoid spaces and some aspects of arithmetic of modular or more generally automorphic forms such as representations mod p lifting of modular forms completed cohomology local Langlands program and special values of L functions All chapters are contributed by experts in the area of arithmetic geometry that will facilitate future research in the direction

Handbook of Algebra, 1995-12-18 Handbook of Algebra defines algebra as consisting of many different ideas concepts and results Even the nonspecialist is likely to encounter most of these either somewhere in the literature disguised as a definition or a theorem or to hear about them and feel the need for more information Each chapter of the book combines some of the features of both a graduate level textbook and a research level survey This book is divided into eight sections Section 1A focuses on linear algebra and discusses such concepts as matrix functions and equations and random matrices Section 1B cover linear dependence and discusses matroids Section 1D focuses on fields Galois Theory and algebraic number theory Section 1F tackles generalizations of fields and related objects Section 2A focuses on category theory including the topos theory and categorical structures Section 2B discusses homological algebra cohomology and cohomological methods in algebra Section 3A focuses on commutative rings and algebras Finally Section 3B focuses on associative rings and algebras This book will be of interest to mathematicians logicians and computer scientists
