[The Electronic Design Automation Handbook](#) Dirk Jansen, 2010-02-23 When I attended college we studied vacuum tubes in our junior year At that time an average radio had ve vacuum tubes and better ones even seven Then transistors appeared in 1960s A good radio was judged to be one with more thenttransistors Later good radios had 15 20 transistors and after that everyone stopped counting transistors Today modern processors runing

personal computers have over 10milliontransistorsandmoremillionswillbeaddedevery year The difference between 20 and 20M is in complexity methodology and business models Designs with 20 tr sistors are easily generated by design engineers without any tools whilst designs with 20M transistors can not be done by humans in reasonable time without the help of Prof Dr Gajski demonstrates the Y chart automation This difference in complexity introduced a paradigm shift which required sophisticated methods and tools and introduced design automation into design practice By the decomposition of the design process into many tasks and abstraction levels the methodology of designing chips or systems has also evolved Similarly the business model has changed from vertical integration in which one company did all the tasks from product speci cation to manufacturing to globally distributed client server production in which most of the design and manufacturing tasks are outsourced

Trade-Offs in Analog Circuit Design Chris Toumazou,George S. Moschytz,Barrie Gilbert,2007-05-08 As the frequency of communication systems increases and the dimensions of transistors are reduced more and more stringent performance requirements are placed on analog circuits This is a trend that is bound to continue for the foreseeable future and while it does understanding performance trade offs will constitute a vital part of the analog design process It is the insight and intuition obtained from a fundamental understanding of performance conflicts and trade offs that ultimately provides the designer with the basic tools necessary for effective and creative analog design Trade offs in Analog Circuit Design which is devoted to the understanding of trade offs in analog design is quite unique in that it draws together fundamental material from and identifies interrelationships within a number

of key analog circuits The book covers ten subject areas Design methodology Technology General Performance Filters Switched Circuits Oscillators Data Converters Transceivers Neural Processing and Analog CAD Within these subject areas it deals with a wide diversity of trade offs ranging from frequency dynamic range and power gain bandwidth speed dynamic range and phase noise to tradeoffs in design for manufacture and IC layout The book has by far transcended its original scope and has become both a designer s companion as well as a graduate textbook An important feature of this book is that it promotes an intuitive approach to understanding analog circuits by explaining fundamental relationships and in many cases providing practical illustrative examples to demonstrate the inherent basic interrelationships and trade offs Trade offs in Analog Circuit Design draws together 34 contributions from some of the world s most eminent analog circuits and systems designers to provide for the first time a comprehensive text devoted to a very important and timely approach to analog circuit design

Selected papers from the 2nd International Symposium on UAVs, Reno, U.S.A. June 8-10, 2009 Kimon P. Valavanis,Randal Beard,Paul Oh,Aníbal Ollero,Leslie A. Piegl,Hayong Shin,2011-04-11 In the last decade significant changes have occurred in the field of vehicle motion planning and for UAVs in particular UAV motion planning is especially difficult due to several complexities not considered by earlier planning strategies the increased importance of differential constraints atmospheric turbulence which makes it impossible to follow a pre computed plan precisely uncertainty in the vehicle state and limited knowledge about the environment due to limited sensor capabilities These differences have motivated the increased use of feedback and other control engineering techniques for motion planning The lack of exact algorithms for these problems and difficulty inherent in characterizing approximation algorithms makes it impractical to determine algorithm time complexity completeness and even soundness This gap has not yet been addressed by statistical characterization of experimental performance of algorithms and benchmarking Because of this overall lack of knowledge it is difficult to design a guidance system let alone choose the algorithm Throughout this paper we

keep in mind some of the general characteristics and requirements pertaining to UAVs A UAV is typically modeled as having velocity and acceleration constraints and potentially the higher order differential constraints associated with the equations of motion and the objective is to guide the vehicle towards a goal through an obstacle field A UAV guidance problem is typically characterized by a three dimensional problem space limited information about the environment on board sensors with limited range speed and acceleration constraints and uncertainty in vehicle state and sensor data
