OUTLINE OF 3DL SINGLE-VIEW VISION PROCESS

•RVision's 3DL Single-View Vision Process function using a 3D Laser Vision Sensor measures the 3D position and posture of a workpiece and compensates the workpiece handling operation of a robot.

Use of •RVision's 3DL Single-View Vision Process function with a 3D Laser Vision Sensor can greatly reduce fixture jigs, which are conventionally required to suppress variations in position and posture during workpiece handling. This can eliminate the cost for manufacturing special jigs for individual models, therefore, implementing a compact system with less peripheral equipment.

For 3D position and posture measurements made by the 3D Laser Vision Sensor to output compensation values to the robot, suitable workpieces are as follows. Workpieces should have the same plane with a size of about at least a 30-mm diameter area in the field of view of the camera to allow laser slit beams to be detected, and have features detectable by the 2D detection function in the field of view of the camera when a 3DL Plane Command Tool is made. For the use of the 3D Laser Vision Sensor in a specific application, contact FANUC.

This manual is intended to help system upgrading by using an example of an application suitable for the use of •RVision's 3DL Single-View Vision Process function using the 3D Laser Vision Sensor.
