concepts and methods for problems within the Risk Reliability and Maintenance RRM context. The concepts and foundations related to RRM are considered for this integration with multicriteria approaches. In the book, a general framework for building decision models is presented and this is illustrated in various chapters by discussing many different decision models related to the RRM context. The scope of the book is related to ways of how to integrate Applied Probability and Decision Making. In Applied Probability, this mainly includes decision analysis and reliability theory amongst other topics closely related to risk analysis and maintenance. In Decision Making, it includes a broad range of topics in MCDM, Multi Criteria Decision Making and MCDA, Multi Criteria Decision Aiding, also known as Multi Criteria Decision Analysis. In addition to decision analysis, some of the topics related to the Mathematical Programming area are briefly considered, such as multiobjective optimization, since methods related to these topics have been applied to the context of RRM. The book addresses an innovative treatment for the decision making in RRM, thereby improving the integration of fundamental concepts from the areas of both RRM and decision making. This is accomplished by presenting an overview of the literature on decision making in RRM. Some pitfalls of decision models when applying them to RRM in practice are discussed, and guidance on overcoming these drawbacks is offered. The procedure enables multicriteria models to be built for the RRM context, including guidance on choosing an appropriate multicriteria method for a particular problem faced in the RRM context. The book also includes many research advances in these topics. Most of the multicriteria decision models that are described are specific applications that have been influenced by this research and the advances in this field.

Multicriteria and Multiobjective Models for Risk Reliability and Maintenance Decision Analysis is implicitly structured in three parts with 12 chapters. The first part deals with MCDM, its concepts, methods, and decision processes. The second part presents the main concepts and foundations of RRM. Finally, the third part deals with specific decision problems in the RRM context approached with MCDM models.

Reliability Models of Complex Systems for Robots and Automation

Hamed Fazlollahtabar, Seyed Taghi Akhavan Niaki, 2017-11-15 Availability of a system is a crucial factor for planning and optimization. The concept is more challenging for modern systems such as robots and autonomous systems consisting of a complex configuration of components. As complex systems have become global and essential in today's society, their reliable design and the determination of their availability have turned into a very important task for managers and engineers. Reliability Models of Complex Systems for Robots and Automation offers different models and approaches for reliability evaluation and optimization of a complex autonomous system. Comprehensive fault tree analysis on the critical components of industrial robots and its integration with the reliability block diagram approach is designed in order to investigate the robot system reliability. The cost and hazard decision tree are integrated for the first time in an approach to evaluate the reliability of a complex system. Considers a complex production system composing of several autonomous robots. Develops binary state reliability evaluation model for a complex system. Introduces new concepts of hazard decision tree. Proposes fault tree and reliability block diagram for complex robotic systems. Develops stochastic process based reliability evaluation and optimization models. Today's competitive world with increasing customer demands for highly reliable products makes reliability engineering a more challenging task. Reliability analysis is one of the main tools to ensure agreed delivery deadlines which in turn maintains certainty in real tangible factors such as customer goodwill and company reputation.
