CLIMATE CHANGE

Overview

In this lab, students will carry out several activities aimed at demonstrating consequences of anthropogenic carbon emissions, climate change, and sea level rise. To do this, students will model how certain gases in Earth's atmosphere trap heat and then how different colors and textures of surfaces reflect differing amounts of sunlight back into space. They will create models of sea level rise resulting from melting of sea ice and glacial ice and examine the effects of this potential consequence of climate change. Students will critically examine the model systems they used in the experiments.

Outcomes

- Explain the causes of increased carbon emissions and their likely effect on global climate.
- Discuss positive and negative climate feedback.
- Distinguish between glacial ice melt and oceanic ice melt.
