Nonlinear Circuits and Systems with Memristors Fernando Corinto, Mauro Forti, Leon O. Chua, 2020-10-31 This book presents a new approach to the study of physical nonlinear circuits and advanced computing architectures with memristor devices. Such a unified approach to memristor theory has never been systematically presented in book form. After giving an introduction on memristor-based nonlinear dynamical circuits, e.g., periodic, chaotic oscillators, and their use as basic computing analogue elements, the authors delve into the nonlinear dynamical properties of circuits and systems with memristors and present the flux-charge analysis, a novel method for analyzing the nonlinear dynamics starting from writing Kirchhoff laws and constitutive relations of memristor circuit elements in the flux-charge domain. This analysis method reveals new peculiar and intriguing nonlinear phenomena in memristor circuits, such as the coexistence of different nonlinear dynamical behaviors, extreme multistability, and bifurcations without parameters. The book also describes how arrays of memristor-based nonlinear oscillators and locally coupled neural networks can be applied in the field of analog computing architectures, for example, for pattern recognition. The book will be of interest to scientists and engineers involved in the conceptual design of physical memristor devices and systems, mathematical and circuit models of physical processes, circuits and networks design, system engineering, or data processing and system analysis. *Feedback, Nonlinear, and*

Distributed Circuits Wai-Kai Chen, 2018-10-08 Upon its initial publication the Handbook of Circuits and Filters broke new ground. It quickly became the resource for comprehensive coverage of issues and practical information that can be put to immediate use. Not content to rest on his laurels, editor Wai kai Chen divided the second edition into volumes making the information easily accessible and digestible. In the third edition these volumes have been revised, updated, and expanded so that they continue to provide solid coverage of standard practices and enlightened perspectives on new and emerging techniques. Feedback, Nonlinear, and Distributed Circuits draws together international contributors who discuss feedback amplifier theory and then move on to explore feedback amplifier configurations. They develop Bode's feedback theory as an example of general feedback theory. The coverage then moves on to the importance of complementing numerical analysis with qualitative analysis to get a global picture of a circuit's performance. After reviewing a wide range of approximation techniques and circuit design styles for discrete and monolithic circuits, the book presents a comprehensive description of the use of piecewise linear methods in modeling analysis and structural properties of nonlinear circuits, highlighting the advantages. It describes the circuit modeling in the frequency domain of uniform MTL based on the Telegrapher's equations and covers frequency and time domain experimental characterization techniques for uniform and nonuniform multiconductor structures. This volume will undoubtedly take its place as the engineer's first choice in looking for solutions to problems encountered in the analysis and behavior predictions of circuits and filters.

Multidimensional Analysis George W. Hart, 2012-12-06 This book deals with the mathematical properties of dimensioned quantities such as length, mass, voltage, and viscosity. Beginning with a careful examination of how one expresses the numerical results of a measurement and uses these results in subsequent manipulations, the author rigorously constructs the notion of dimensioned numbers and discusses their algebraic structure. The result is a unification of linear algebra and traditional dimensional analysis that can be extended from the scalars to which the traditional analysis is perforce restricted to multidimensional vectors of the sort frequently encountered in engineering systems theory, economics, and other applications.

Chua's Circuit: A Paradigm For Chaos Rabinder N. Madan, 1993-11-20 For uninitiated researchers, engineers, and scientists interested in a quick entry into the subject of chaos, this book offers a timely collection of 55 carefully selected papers covering almost every aspect of this subject. Because Chua's circuit is endowed with virtually every bifurcation phenomena reported in the extensive literature on chaos and because it is the only chaotic system which can be easily built by a novice, simulated in a personal computer, and tractable mathematically, it has become a paradigm for chaos and a vehicle for illustrating this ubiquitous phenomenon. Its supreme simplicity and robustness has made it the circuit of choice for generating chaotic signals for practical applications. In addition to the 48 illuminating papers drawn from a recent two-part Special Issue, March and June 1993 of the Journal of Circuits, Systems, and Computers devoted exclusively to Chua's circuit, several highly illustrative tutorials and incisive state-of-

the art reviews on the latest experimental computational and analytical investigations on chaos are also included To enhance its pedagogical value a diskette containing a user friendly software and data base on many basic chaotic phenomena is attached to the book as well as a gallery of stunningly colorful strange attractors Beginning with an elementary freshman level physics introduction on experimental chaos the book presents a step by step guided tour with papers of increasing complexity which covers almost every conceivable aspects of bifurcation and chaos The second half of the book contains many original materials contributed by world renowned authorities on chaos including L P Shil'nikov A N Sharkovsky M Misiurewicz A I Mees R Lozi L O Chua and V S Afraimovich The scope of topics covered is quite comprehensive including at least one paper on each of the following topics routes to chaos 1 D maps universality self similarity 2 parameter renormalization group analysis piecewise linear dynamics slow fast dynamics confor analysis symmetry breaking strange attractors basins of attraction geometric invariants time series reconstruction Lyapunov exponents bispectral analysis homoclinic bifurcation stochastic resonance synchronization and control of chaos as well as several novel applications of chaos including secure communications visual sensing neural networks dry turbulence nonlinear waves and music

Laboratory Manual for Nonlinear Physics with Maple for Scientists and Engineers Richard H. Enns, George McGuire, 2012-12-06 Science demands that all theory must be checked by experiment Richard Feynman Nobel Laureate in physics 1965 reminds us in a wonderful quote that The test of all knowledge is experiment Experiment is the sole judge of scientific truth 1 It is because nonlinear physics can be so profoundly counter intuitive that these laboratory investigations are so important This manual is designed to be used with the text Nonlinear Physics with Maple for Scientists and Engineers Understanding is enhanced when experiments are used to check so please attempt as many of the activities as you can As you perform theory these activities we hope that you will be amazed and startled by strange behavior intrigued and terrorized by new ideas and be able to amaze your friends as you relate your strange sightings Remember that imagination is just as important as knowledge so exercise yours whenever possible But please be careful as nonlinear activities can be addicting can provide fond memories and can awaken an interest that lasts a lifetime Although it has been said that a rose by any other name is still a rose with apologies to Shakespeare the authors of this laboratory manual have in an endeavor to encourage the use of these nonlinear investigations called them experimental activities rather than experiments A number of design innovations have been introduced A **Whitaker's Book List** ,1987 *Proceedings of the ... Contemporary Linear Systems Using MATLAB Robert D. Strum, Donald E. Kirk, 1994

This is a title in the PWS series BookWare Companion Series. It is a set of correlated self-contained courseware modules covering fundamental concepts in engineering and applied mathematics. Students work through example problems electronically and are encouraged to experiment with problems and data in an electronic lab setting. Each BookWare Companion features a software script for the electronic examples based on a popular applications software package for the IBM PC or the Macintosh and a printed volume containing computer-based exploration exercises and a variety of learning aids and hints. The text, bolstered by illustrative examples, 200 problems, and MATLAB exploration exercises on the accompanying data disk, should enable students to work with linear systems problems in a virtual laboratory at the computer, changing problem values at will in a what-if fashion.

Untangling Complex Systems Pier Luigi Gentili, 2018-09-03

Complex systems are natural systems that science is unable to describe exhaustively. Examples of complex systems are both unicellular and multicellular living beings, human brains, human immune systems, ecosystems, human societies, the global economy, the climate, and geology of our planet. This book is an account of a marvelous interdisciplinary journey the author made to understand properties of the complex systems. He has undertaken his trip equipped with the fundamental principles of physical chemistry, in particular the Second Law of Thermodynamics that describes the spontaneous evolution of our universe, and the tools of non-linear dynamics. By dealing with many disciplines, in particular chemistry, biology, physics, economy, and philosophy, the author demonstrates that complex systems are intertwined networks working in and out of equilibrium conditions which exhibit emergent properties such as self-organization phenomena and chaotic behaviors in time and space.
