High Power Lasers In Production

Engineering Dieter Schuocker, 1999-03-03 High power lasers of either the gas or solid state type can be used to generate a focal spot with a diameter of about a tenth of a millimetre and a power density of up to 100 Mio W cm² With these intensities all materials can be heated up rapidly leading to fast melting violent evaporation or even plasma formation So laser beams can be utilized for various processing tasks such as transformation hardening cutting and ablation or welding and cladding or even rapid prototyping With these processes important advantages are achieved compared to conventional tools such as high processing speed due to the high concentration of energy and high quality of the processed workpiece without deformations due to the small overall heat input to the workpiece that corresponds to the small spot diameter All these advantages finally result in strongly reduced production costs which is the main reason for a world wide substitution of conventional processes and other beam tools by laser technology This monograph offers a great insight into the operation principles of high power laser sources the phenomena of interaction of laser beams and materials and the mechanisms of the various production processes with lasers thus enabling production engineers and others to make optimum use of the benefits of laser technology and to understand the technical properties and the physical limitations of this most recent technology especially in comparison to conventional tools and other beam tools and providing a sufficient basis for the understanding and use of future developments in this area

Handbook of

the EuroLaser Academy Dieter Schuocker, 2012-10-23 If in some processes oxygen is used additional energy is provided at a rate P_{ch} by chemical reactions The flow of energy per unit time can then be written $\frac{1}{2} P_{ch}$ From the above it can be made clear that it is the rate of energy fluxes $\frac{1}{2} P_{ch}$ intensities J/m^2 that determines into which channel the energy goes and how the interaction zone will be modified in its state solid liquid gaseous and geometrical shape plane dip deep hole in other words which kind of treatment process will be established hardening welding drilling etc In the following it will be shown that in fact it is the intensity of the beam which together with the interaction time primarily governs the interaction phenomena $\frac{1}{2} P_{ch}$ Laser beam properties determining interaction and energy coupling etJeets In order to yield an efficient process it is necessary to obtain adequate intensity at the workpiece and to couple a fraction of the incident power as high as possible into the material The beam properties being of importance in this respect are Hugel 1992 1 the wavelength λ governing in

principle the focusability and absorptivity 2 the polarisation having considerable influence on the absorptivity for large angles of incidence 3 the power P which together with the achievable spot diameter d $L f$ determines the intensity in the interaction zone 4
