examination of the psychological milestones of human development during its first decade and what has been learned about brain growth This volume proposes that development is the process of experience working on a brain that is undergoing significant biological maturation Experience counts but only when the brain has developed to the point of being able to process encode and interact with these new environmental experiences This book's aim is to acquaint developmental biologists and neuroscientists with what has been learned about human psychological development and to acquaint developmental psychologists with the biological evidence The hope is that each group will gain a richer appreciation of both knowledge corpora The authors hope to appeal to neuroscientists psychologists psychiatrists pediatricians and their students The idea for this book was born in 1993 when the authors a leading developmental psychologist and a pediatrician met for the first time and recognized the complementarity of their backgrounds and the utility of a collaboration The reception of their first two papers motivated this attempt to synthesize the available information over a longer developmental era

**The Self-Assembling Brain** Peter Robin Hiesinger, 2022-12-13 In this book Peter Robin Hiesinger explores historical and contemporary attempts to understand the information needed to make biological and artificial neural networks. Developmental neurobiologists and computer scientists with an interest in artificial intelligence driven by the promise and resources of biomedical research on the one hand and by the promise and advances of computer technology on the other are trying to understand the fundamental principles that guide the generation of an intelligent system. Yet though researchers in these disciplines share a common interest their perspectives and approaches are often quite different. The book makes the case that the information problem underlies both fields driving the questions that are driving forward the frontiers and aims to encourage cross disciplinary communication and understanding to help both fields make progress. The questions that challenge researchers in these fields include the following: How does genetic information unfold during the years long process of human brain development and can this be a short cut to create human level artificial intelligence? Is the biological brain just messy hardware that can be improved upon by running learning algorithms in computers? Can artificial intelligence bypass evolutionary programming of grown networks? These questions are tightly linked and answering them requires an understanding of how information unfolds algorithmically to generate functional neural networks. Via a series of closely linked discussions, fictional dialogues between researchers in different disciplines and pedagogical seminars the author explores the different challenges facing researchers working on neural networks, their different perspectives and approaches as well as the common ground and understanding to be found amongst those sharing an interest in the development of biological brains and artificial intelligent systems.
