The Sustainability of Air Transportation Milan Janic, 2017-03-02. This book presents for the first time a comprehensive analysis and assessment of the sustainability of the contemporary civil air transport system, examining its three main components: airports, air traffic control, and airlines. It offers an in-depth examination and quantitative insight into the system's current and prospective structure and operations, as well as the related effects and impacts. The sustainability of the air transport system is considered along a global trajectory of growing effects and diminishing and/or stagnating impacts on society and environment under conditions of continuous growth. In doing so, the author examines the situations of users of the system: passengers and freight shippers, air transport operators, airports, air traffic control, and airlines, aerospace manufacturers, local and national communities, policymakers, and the general public. The book possesses the unique and distinctive feature of providing an analysis and assessment of the air transport system's sustainability through elaboration of its technical, technological, operational, economic, social, environmental, and institutional performances and their causality. It is written for advanced graduate and postgraduate students, researchers, planners, stakeholders, and policymakers dealing with the various sustainability issues of the contemporary air transport system.

Transport Terminals and Modal Interchanges Christopher Blow, 2012-05-23. This is the first book to review a trend in transport systems which has only recently come of age: the multi-modal interchange. Separate modes of transport are being linked through joined-up thinking, and transport designers and authorities are only now able to exploit interchange opportunities. This book presents examples of how these new opportunities have been planned and designed, and outlines how transfer and mobility can be improved in the future. Blow takes the airport as the

focal point of true multi modal passenger terminals and presents the development of these buildings as representing a new experience in travel The book shows that the success of the experience of transferring from one mode of transport to another depends on the many factors including congestion in an already overloaded system and the way that designers and managers have addressed contingency planning International examples are drawn from areas where mobility is most concentrated and the demands on design are at their highest The book also addresses important issues of rebuilding and redevelopment where once separate modes of transport are being linked to each other and where short term inconveniences rectify past wrongs in the long term It is a compendium of architectural and engineering achievement
