Relational Database Systems Joachim W. Schmidt, Michael L. Brodie, 2012-12-06 After a long period of research development test and trial relational database management systems are at last being marketed in force The feedback from early installations of these systems is overwhelmingly positive The most frequent comment by users is that productivity has been increased by a significant factor from 5 to 20 times what it was using previous approaches Another comment is that in many cases end users can now handle their own problems by direct use of the system instead of using application programmers as mediators between them and the system As the reputation of relational systems for ease of use and enhanced productivity has grown there has been a strong temptation for vendors of other approaches to exploit the label relational somewhat indiscriminately In some cases the label is being misapplied to a whole data system in others it is being misapplied to an interface It is therefore worth developing criteria which database management systems DBMSs should have in order to be called relational The Relational Task Group RTG of the American National Standards Institute ANSI undertook such an effort by developing a characterization of RDBMSs and analyzing fourteen DBMSs per this characterization The result of this work is presented in this book The conclusions of the RTG are in agreement with my view that a DBMS should not be called relational unless it satisfies at least the following conditions 1 All information in the database is represented as values in tables

Advanced Studies Institute on Data Base Management Theory and Applications The meeting took place in Estoril Portugal for a two week period in June 1981 The lecturers represented distinguished research centers in industry government and academia Lectures presented basic material in data base management as well as sharing recent developments in the field The participants were drawn from data processing groups in government industry and academia located in NATO countries All participants had a common goal of learning about the exciting new developments in the field of data base management with the potential for application to their fields of interest In addition to formal lectures and the informal discussions among participants which are characteristic of NATO AS gatherings participants had the opportunity for hands on experience in building application systems with a data base management system Participants were organized into groups that designed and implemented application systems using data base technology on micro computers The collection of papers is organized into four major sections The first section deals with various aspects of data modeling from the conceptual and logical perspectives These issues are crucial in the initial design of application systems

Flexible Query Answering Systems Henrik L. Larsen, Janusz Kacprzyk, Slawomir Zadrozny, Troels Andreassen, Henning Christiansen, 2012-08-27 This volume constitutes the proceedings of the Fourth International Conference on Flexible Query Answering Systems FQAS 2000 held in Warsaw Poland on October 25-28 2000 The FQAS conference has been the premier conference focusing on one of key issues that the information society faces namely that of providing easy flexible intuitive access to information for everybody In targeting this issue the conference draws on several research areas such as databases querying information retrieval knowledge representation soft computing cyberspace multimedia systems human computer interaction etc FQAS 2000 has been preceded by the extremely successful FQAS 94 FQAS 96 and FQAS 98 conferences all held in Roskilde Denmark The present conference provides a unique opportunity for researchers developers and practitioners to explore new ideas and approaches in a multidisciplinary forum As a metaphor for flexible query answering we may consider a human intermediary who has expertise in the topic of the query and is experienced in identifying the user's information needs and answering the needs from the available information resources The use of knowledge on relevant contexts available information resources etc enables the expert to respond rather precisely to the needs though the query per se may be imprecise incomplete etc Thus a key issue for flexible query answering system is to obtain maintain represent and utilize such knowledge This comprises domain knowledge and metaknowledge its representation and organization in ontologies terminologies etc

Estimating the Query Difficulty for Information Retrieval David Carmel,Elad Yom-Tov,2022-05-31 Many information retrieval IR systems suffer from a radical variance in performance when responding to users queries Even for systems that succeed very well on average the quality of results returned for some of the queries is poor Thus it is desirable that IR systems will be able to identify difficult queries so they can be handled properly Understanding why some queries are inherently more difficult than others is essential for IR and a good answer to this important question will help search engines to reduce the variance in performance hence better servicing their customer needs Estimating the query difficulty is an attempt to quantify the quality of search results retrieved for a query from a given collection of documents This book discusses the reasons that cause search engines to fail for some of the queries and then reviews recent approaches for estimating query difficulty in the IR field It then describes a common methodology for evaluating the prediction quality of those estimators and experiments with some of the predictors applied by various IR methods over several TREC benchmarks Finally it discusses potential applications that can utilize query difficulty estimators by handling each query individually and selectively based upon its estimated difficulty Table of Contents Introduction The Robustness Problem of Information Retrieval Basic Concepts Query Performance Prediction Methods Pre Retrieval Prediction Methods Post Retrieval Prediction Methods Combining Predictors A General Model for Query Difficulty Applications of Query Difficulty Estimation Summary and Conclusions

Query Processing in Database Systems W. Kim,D.S. Reiner,Don Batory,2012-12-06 This book is an anthology of the results of research and development in database query processing during the past decade The relational model of data provided tremendous impetus for research into query processing Since a relational query does not specify access paths to the stored data the database management

system DBMS must provide an intelligent query processing subsystem which will evaluate a number of potentially efficient strategies for processing the query and select the one that optimizes a given performance measure The degree of sophistication of this subsystem often called the optimizer critically affects the performance of the DBMS Research into query processing thus started has taken off in several directions during the past decade The emergence of research into distributed databases has enormously complicated the tasks of the optimizer In a distributed environment the database may be partitioned into horizontal or vertical fragments of relations Replicas of the fragments may be stored in different sites of a network and even migrate to other sites The measure of performance of a query in a distributed system must include the communication cost between sites To minimize communication costs for queries involving multiple relations across multiple sites optimizers may also have to consider semi join techniques **Technical Abstract Bulletin** ,1964 **Implementing**
