Andrews, 2012-12-06 The most important feature of the modern synthetic theory of evolution is its foundation upon a great variety of biological disciplines G L STEBBINS 1968 p 17 This book is written with the goal of presenting ecologically significant analogies between the biology of microorganisms and macroorganisms I consider such parallels to be important for two reasons First they serve to emphasize that however diverse life may be there are common themes at the ecological level not to mention other levels Second research done with either microbes or macroorganisms has implications which transcend a particular field of study Although both points may appear obvious the fact remains that attempts to forge a

conceptual synthesis are astonishingly meager While unifying concepts may not necessarily be strictly correct they enable one to draw analogies across disciplines New starting points are discovered as a consequence and new ways of looking at things emerge The macroscopic organisms macroorganisms include most representatives of the plant and animal kingdoms I interpret the term microorganism microbe literally to mean the small or microscopic forms of life and I include in this category the bacteria the protists excluding the macroscopic green brown and red algae and the fungi Certain higher organisms such as many of the nematodes fall logically within this realm but are not discussed at any length Current Catalog National Library of Medicine (U.S.), First multi year cumulation covers six years 1965 70 Federal Advisory Committees United States.
