Availability Solution for System z from a Linux Perspective Lydia Parziale,Guillaume Lasmayous,Manoj S

Pattabhiraman,Karen Reed,Jing Xin Zhang,IBM Redbooks,2014-10-30 As Linux on System z becomes more prevalent and mainstream in the industry the need for it to deliver higher levels of availability is increasing This IBM Redbooks publication starts with an explanation of high availability HA fundamentals such as HA concepts and terminology It continues with a discussion of why a business needs to consider an HA solution and then explains how to determine your business single points of failure We outline the components of a high availability solution and describe these components Then we provide some architectural scenarios and demonstrate how to plan and decide an implementation of an end to end HA solution from Linux on System z database scenarios to z OS and include storage network z VM Linux and middleware This implementation includes the IBM Tivoli System Automation for Multiplatforms TSA MP which monitors and automates applications distributed across Linux AIX and z OS operating systems as well as a GDPS based solution It includes the planning for an end to end scenario considering Linux on System z z VM and z OS operating environments and the middleware used The TSA MP implements HA for infrastructure network operating systems and applications across multiple platforms and is compared to a Linux HA implementation based on open source Linux HA which is Linux only IBM InfoSphere Replication Server and

High Availability and Disaster Recovery for Temenos T24 with IBM DB2 and AIX Barrie Mike, Moditha Sanjay De Costa, Gowrimani Gopalakrishnan, Murali Neralla, IBM Redbooks, 2012-10-09 The Temenos T24 core banking application is a critical application for the banks that use it and has a primary focus on providing an appropriate level of high availability and disaster recovery The level of availability is determined largely by the configuration of the infrastructure that supports T24 This infrastructure is built on hardware middleware and networking in addition to the operational procedures and practices that are used to operate T24 Many options are available for meeting a client s high availability and disaster recovery requirements The solution chosen by a Temenos T24 user depends on many factors These factors include a user s detailed availability and recovery requirements their existing datacenter standards practices and processes and the available network infrastructure Therefore the optimum solution must be determined on a case by case basis for each deployment This IBM Redpaper™ publication serves as a guide to help IT architects and other technical staff who are designing configuring and building the infrastructure to support Temenos T24 It shows how IBM software can deliver high availability and disaster recovery for Temenos T24 to meet a client s requirements This software might run on IBM AIX IBM WebSphere Application Server WebSphere MQ Server and IBM DB2 These IBM software components are typically used for a Temenos T24 deployment on an IBM middleware stack to ensure a highly available infrastructure for T24
