

Figure 3: Manual failover to DR site

Variations of the design

This basic design can be modified in a variety of ways. Below are some of the possible variations on the example design presented in this paper.

Additional replicas

The AlwaysOn Availability Groups feature allows for up to four secondary replicas; two synchronous and two asynchronous.

Combine with other HA features

Other SQL Server high availability features, such as, Failover Clustered Instances, can be combined with AlwaysOn Availability Groups. This means that four, five, or more servers could be utilized to create higher availability.

Multiple databases

The concept of a replica collects together one or more databases, so, in the event of a failover, multiple databases failover together.

Virtualization variations

The design of this paper uses Hyper-V Virtual Machines (VM) and SQL Server is installed within each VM. However, it is also possible to install SQL Server directly on the physical servers.

Pass-through disks

In this design, the storage has also been provisioned using VHDX formatted virtual disks. However, the storage could also be implemented on the physical disks using pass-through disks.

Secondary functional requirements

In addition to the main purpose of the design, which is to provide redundancy in the event of various failures, there are other benefits.
