**Abstract** The purpose of this study was to examine the effects of a 6-week training program on the physical fitness and health-related quality of life (HRQL) of sedentary elderly people. A total of 70 elderly people were randomly assigned to either a control group or an exercise group. The exercise group performed a supervised aerobic and resistance training program three times per week for six weeks. Physical fitness parameters measured included maximum oxygen consumption ( $\dot{V}O_{2\max}$ ), peak power output (PPO), and peak heart rate (HR). HRQL was assessed using the EuroQOL-5D questionnaire. After six weeks, the exercise group showed significant improvements in  $\dot{V}O_{2\max}$ , PPO, and HR compared to the control group. Additionally, the exercise group reported higher scores on the EuroQOL-5D questionnaire, indicating improved HRQL. These findings suggest that a structured exercise program can effectively improve physical fitness and HRQL in sedentary elderly individuals.
