Childhood Head Injury Maureen Dennis, Harvey S. Levin, 2016-03-23 Childhood head injuries differ from adult head injuries in some significant respects They occur against a background of ongoing physical and cognitive development Cognitive capacities often change with time post injury But for children changes are affected by two processes of functional plasticity one concerned with recovery one with development The impact of the injury is moderated by age developmental stage In recent years there has been a new focus on the longitudinal comparison of children post injury with appropriate control groups Advances in neuropsychological assessment have permitted evaluation with reference to more developmentally suitable norms expanded definitions of outcome have broadened our understanding of consequences and

neuroimaging techniques have enabled the more precise delineation of injury severity the study of structure function outcome relations and the investigation of reorganization of function This special issue offers an overview of cutting edge approaches to the analysis of childhood head injury Autism: The Movement (Sensing) Perspective a Decade Later Elizabeth B. numerate because numerical abilities are not only essential for life prospects of individuals but also for economic interests of post industrial knowledge societies Thus numerical development is at the core of both individual as well as societal interests There is the notion that we are already born with a very basic ability to deal with small numerosities Yet this often called number sense seems to be very restricted approximate and driven by perceptual constraints During our numerical development in formal e g school but also informal contexts e g family street we acquire culturally developed abstract symbol systems to represent exact numerosities in particular number words and Arabic digits refining our numerical capabilities In recent years numerical development has gained increasing research interest documented in a growing number of behavioural neuro scientific educational cross cultural and neuropsychological studies addressing this issue Additionally our understanding of how numerical competencies develop has also benefitted considerably from the advent of different neuro imaging techniques allowing for an evaluation of developmental changes in the human brain In sum we are now starting to put together a more and more coherent picture of how numerical competencies develop and how this development is associated with neural changes as well In the end this knowledge might also lead to a better understanding of the reasons for atypical numerical development which often has grievous consequences for those who suffer from developmental dyscalculia or mathematics learning disabilities Therefore this Research Topic deals with all aspects of numerical development findings from behavioural performance to underlying neural substrates from cross sectional to longitudinal evaluations from healthy to clinical populations To this end we included empirical contributions using different experimental methodologies but also theoretical contributions review articles or opinion papers *Encyclopedia of Special Education* Cecil R.
