Science SOL 5.2- Plants & Animals

Deliverable: Plants and animals have different processes and structures that allow them to carry out Photosynthesis and to grow/develop/respire.

Plants are composed of parts that function in growth, movement, life processes, and to carry out photosynthesis.

Plant Structure

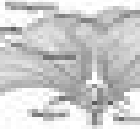

- Root:** anchors the plant into the soil and absorbs water and nutrients.
- Stem:** supports the plant and transports water and nutrients.
- Leaf:** carries out photosynthesis and transpiration.
- Flower:** produces seeds and fruits.
- Fruit:** protects the seeds and aids in dispersal.

Photosynthesis

Plants use carbon dioxide from the atmosphere and the process of photosynthesis. They use the green pigment chlorophyll to capture light energy from the sun and convert it into glucose (sugar). The leaf is the primary site for photosynthesis. Oxygen is released during photosynthesis.

Equation: $\text{Carbon Dioxide} + \text{Water} + \text{Light} \rightarrow \text{Glucose} + \text{Oxygen}$

Photosynthesis stores energy in the glucose produced from the carbon dioxide and water that are taken up by the plant.

Flower Structure

The flower is the reproductive part of the plant. It is composed of several parts: the petals, sepals, stamens, and pistils. The stamens are the male reproductive organs, and the pistils are the female reproductive organs. The pistil is composed of the ovary, which contains the egg cells, and the style, which leads to the stigma, where the pollen lands.

Transpiration

Plants lose water through their leaves in a process called transpiration. This process is driven by the sun's energy, which causes water to evaporate from the leaves. Transpiration helps to cool the plant and move water and nutrients up from the roots.
