Newman, 2014-12-16 An integrated analysis exploring current and relevant concepts Fundamentals of Ecotoxicology The Science of Pollution Fourth Edition extends the dialogue further from the previous editions and beyond conventional ecosystems It explores landscape regional and biospheric topics communicating core concepts with subjects ranging from molecular to global issues It addresses the increasing growth and complexity of ecotoxicological problems contains additional vignettes and employs input from a variety of experts in the field Divided into 14 chapters the book begins with an overall history of the field It details the essential features of the key contaminants of concern today including their sources It examines bioaccumulation the effects of contaminants at increasing levels of ecological organization and the regulatory aspects of the field addressing the technical issues of risk assessment The author includes appendices illustrating important environmental laws and regulations and compiles key terms not already identified by section headings in the glossary He also provides suggested readings at the end of each chapter and presents study questions at the end of the book Fundamentals of Ecotoxicology The Science of Pollution Fourth Edition contains a broad overview of ecotoxicology and provides a basic understanding of the field Designed as a textbook for use in introductory graduate or upper level undergraduate courses in ecotoxicology applied ecology environmental pollution and environmental science it can also be used as a general reference for practicing environmental toxicologists      Selected Water Resources Abstracts, 1991      Gas Transport in Porous Media Clifford K. Ho, Stephen W. Webb, 2006-10-07 CLIFFORD K HO AND STEPHEN W WEBB Sandia National Laboratories P O Box 5800 Albuquerque NM 87185 USA Gas and vapor transport in porous media occur in a number of important applications including drying of industrial and food products oil and gas exploration environmental remediation of contaminated sites and carbon sequestration Understanding the fundamental mechanisms and processes of gas and vapor transport in porous media allows models to be used to evaluate and optimize the performance and design of these systems In this book gas and vapor are distinguished by their available states at standard temperature and pressure 20 °C 101 kPa If the gas phase constituent can also exist as a liquid phase at standard temperature and pressure e.g. water ethanol toluene trichloroethylene it is considered a vapor If the gas phase constituent is non condensable at standard temperature and pressure e.g. oxygen carbon dioxide helium hydrogen propane it is considered a gas The distinction is important because different processes affect the transport and behavior of gases and vapors in porous media For example mechanisms specific to vapors include vapor pressure lowering and enhanced vapor diffusion which are caused by the presence of a liquid phase constituent interacting with its liquid phase in an unsaturated porous media In addition the heat pipe exploits isothermal

latent heat exchange during evaporation and condensation to effectively transfer heat in designed and natural systems
