

Preservation of organ function in head and neck cancer

Abstract

Preservation of function is a crucial aspect for the evaluation of therapies applied in the field of head and neck cancer. However, preservation of anatomic structures cannot automatically be equated with preservation of function. Functional outcome becomes increasingly important particularly for the evaluation of alternative treatment options with equivalent oncological outcomes.

As a result, present studies take into account three topic areas with varying emphasis: (1) the effects of cancer therapy on essential physiological functions, (2) additional therapy-induced side-effects and complications, and (3) health-related quality of life.

The present article summarizes vital aspects of clinical research from recent years. Functional outcomes after surgical and non-surgical treatment approaches are presented according to tumor localization and staging criteria. Additional methodological aspects relating to data gathering and documentation as well as challenges in implementing the results in clinical practice are also discussed.

Keywords: head and neck cancer, oral cancer, oropharyngeal cancer, laryngeal cancer, organ preservation, toxicity, quality of life, functional outcome

Introduction

From an oncological perspective, it is particularly important that recurrences and secondary malignancies have to be recognized and treated as early as possible in the course of cancer follow-up among patients with head and neck cancer (HNC). Further goals include the treatment of functional and psychosocial issues, and an efficiency assessment of the therapy that has taken place [1].

Patients with HNC suffer from a variety of problems, e.g. with breathing, eating, speaking, pain, and psychic difficulties, that follow a cancer diagnosis, and individual changes in their day-to-day lives. Examples of this are participating in meals within their usual social setting, conducting personal hygiene, oral communication, and pursuit of their professional and social activities. According to the World Health Organization (WHO), all these aspects are summarized under the term "functioning" [2]. The assessment of functioning after cancer treatment has become a key component of many clinical studies in recent years. The extent of functional problems is considered an independent predictor of patient survival [3], [4], [5], [6].

Beyond that, it would be desirable to make comparative statements on the (expected) functional results of oncologically equivalent therapies to be able to give patients more detailed advice on their therapy decisions.

Another term that is meaningful in this context is "health-related quality of life." It represents a subjective psychological notion that assesses health status from the perspective of the patient affected. It is defined as a multidimensional notion that encompasses physical, mental,

social and behavioral components of well-being and functioning from the viewpoint of the patient [7].

Despite great interest and a correspondingly large number of publications on the topic, it is difficult overall to draw conclusions for clinical care. This is partly due to methodological limitations of the studies (imprecise details on tumor localization and the therapy conducted, small case numbers, few randomized controlled studies, limited longitudinal data, etc.), but also to two content-related challenges. First, the lack of a definition for the criteria of functioning across all health professional groups, and secondly a quite large and non-homogenous group of different instruments with which functioning is measured. Some of these instruments vary so much among each other, that it is hard to design suitable meta-analyses [8], [9], [10].

The goal of this review paper is to summarize the current status of knowledge on the topic of preservation of function in HNC. It will also discuss methodological aspects of data gathering and documentation as well as challenges of implementation in clinical practice.

Diagnostic methods

Many outcome instruments have been developed and validated for different study questions over the past few years. Comparisons of diverse target parameters for measuring functional outcome in clinical studies reveal a large spectrum of patient-, investigator- and/or technology-based outcome instruments [11], [12], [13]. present the anatomy and physiology of swallowing and the pathophysiology of the dysphagia related structures. It discusses assessment of dysphagia in detail highlighting clinical and instrumental evaluations. Swallowing dysfunction related to common sub site cancers and chemo radiotherapy related dysphagia are explored individually. The book addresses direct and indirect swallowing therapy methods involving postures and exercises in a detailed yet simple manner to enable them to be incorporated in routine practice. It also covers topics like nutritional management, alternative feeding methods and unique problems associated with tracheostomy that have a great bearing on the day to day management of patients with dysphagia. The current status of the research and evidence based management updates are also included. Additionally where appropriate videos are included for a better understanding of the subject. Written and edited by experts in the field, the book is intended for clinicians treating head and neck cancer: head and neck surgeons, radiation oncologists, speech and swallowing therapy specialists and trainees in these fields.

Cancer of the Head and Neck Jatin P. Shah, American Cancer Society, 2001. Dr Jatin P Shah has brought together contributing authors in a single volume that represents the head and neck management team at Memorial Sloan Kettering Cancer Center. The strength of the volume is in its internal consistency of diagnostic approaches, therapeutic decisions, multidisciplinary treatment programs and surgical techniques. An effort has also been made to be comprehensive and to give a balanced view to other treatment approaches. Essential to the diagnosis and treatment of the disease is the involvement of a multidisciplinary management team of medical experts. Such disease management teams develop treatment algorithms and establish treatment guidelines to unify an approach to maintain internal consistency, initiate investigative protocols and push the frontiers in the battle against cancer.

Oral, Head and Neck Oncology and Reconstructive Surgery - E-Book R. Bryan Bell, Peter A. Andersen, Rui P. Fernandes, 2017-08-25. Oral Head and Neck Oncology and Reconstructive Surgery is the first multidisciplinary text to provide readers with a system for managing adult head and neck cancers based upon stage. Using an evidence based approach to the management and treatment of a wide variety of clinical conditions, the extensive experience of the author and contributors in head and neck surgery and oncology are highlighted throughout the text. This includes computer aided surgical simulation, intraoperative navigation, robotic surgery, endoscopic surgery, microvascular reconstructive surgery, molecular science and tumor immunology. In addition, high quality photos and illustrations are included which are easily accessible on mobile devices. Management protocols and outcomes assessment provide clear guidelines for managing problems related to adult head and neck oncology and reconstructive surgery. State of the art guidance by recognized experts details current techniques as well as technological advances in head and neck, cranio maxillofacial surgery and oncology. Evidence based content details the latest diagnostic and therapeutic options for treating a wide variety of clinical problems with an emphasis on surgical technique and outcomes.
