Homogeneous Flows Moduli Spaces And Arithmetic Clay Mathematics Proceedings:

Homogeneous Flows, Moduli Spaces, and Arithmetic Clay Mathematics Institute. Summer School, 2010 This book contains a wealth of material concerning two very active and interconnected directions of current research at the interface of dynamics number theory and geometry Examples of the dynamics considered are the action of subgroups of $\mathrm{SL}(n, \mathbb{R})$ on the space of unit volume lattices in $\mathbb{R}^n$ and the action of $\mathrm{SL}(2, \mathbb{R})$ or its subgroups on moduli spaces of flat structures with prescribed singularities on a surface of genus $g \geq 2$ Topics covered include the following a Unipotent flows non divergence the classification of invariant measures equidistribution orbit closures b Actions of higher rank diagonalizable groups and their invariant measures including entropy theory for such actions c Interval exchange maps and their connections to translation surfaces ergodicity and mixing of the Teichmüller geodesic flow dynamics of rational billiards d Application of homogeneous flows to arithmetic including applications to the distribution of values of indefinite quadratic forms at integral points metric Diophantine approximation simultaneous Diophantine approximations counting of integral and rational points on homogeneous varieties e Eigenfunctions of the Laplacian entropy of quantum limits and arithmetic quantum unique ergodicity f Connections between equidistribution and automorphic forms and their L functions The text includes comprehensive introductions to the state of the art in these important areas and several surveys of more advanced topics including complete proofs of many of the fundamental theorems on the subject It is intended for graduate students and researchers wishing to study these fields either for their own sake or as tools to be applied in a variety of fields such as arithmetic Diophantine approximations billiards etc

Ergodic Theory and Negative Curvature Boris Hasselblatt, 2017-12-15 Focussing on the mathematics related to the recent proof of ergodicity of the Weil-Petersson geodesic flow on a nonpositively curved space whose points are negatively curved metrics on surfaces this book provides a broad introduction to an important current area of research It offers original textbook level material suitable for introductory or advanced courses as well as deep insights into the state of the art of the field making it useful as a reference and for self study The first chapters introduce hyperbolic dynamics ergodic theory and geodesic and horocycle flows and include an English translation of Hadamard's original proof of the Stable Manifold Theorem An outline of the strategy motivation and context behind the ergodicity proof is followed by a careful exposition of it using the Hopf argument and of the pertinent context of Teichmüller theory Finally some complementary lectures describe the deep connections between geodesic flows in negative curvature and Diophantine approximation

Elements of Dynamical Systems Anima Nagar, Riddhi Shah, Shrihari Sridharan, 2022-11-11 This book stems from lectures that were delivered at the three week Advanced Instructional School on Ergodic Theory and Dynamical Systems held at the Indian Institute of Technology Delhi from 4-23 December 2017 with the support of the National Centre for Mathematics National Board for Higher Mathematics Department of Atomic Energy Government of India The book discusses various aspects of dynamical systems Each chapter of this book specializes in one

aspect of dynamical systems and thus begins at an elementary level and goes on to cover fairly advanced material The book helps researchers be familiar with and navigate through different parts of ergodic theory and dynamical systems

Probability and Statistical Physics in Two and More Dimensions Clay Mathematics Institute. Summer School, 2012 This volume is a collection of lecture notes for six of the ten courses given in Buzios Brazil by prominent probabilists at the 2010 Clay Mathematics Institute Summer School Probability and Statistical Physics in Two and More Dimensions and at the XIV Brazilian School of Probability In the past ten to fifteen years various areas of probability theory related to statistical physics disordered systems and combinatorics have undergone intensive development A number of these developments deal with two dimensional random structures at their critical points and provide new tools and ways of coping with at least some of the limitations of Conformal Field Theory that had been so successfully developed in the theoretical physics community to understand phase transitions of two dimensional systems Included in this selection are detailed accounts of all three foundational courses presented at the Clay school Schramm Loewner Evolution and other Conformally Invariant Objects Noise Sensitivity and Percolation Scaling Limits of Random Trees and Planar Maps together with contributions on Fractal and Multifractal properties of SLE and Conformal Invariance of Lattice Models Finally the volume concludes with extended articles based on the courses on Random Polymers and Self Avoiding Walks given at the Brazilian School of Probability during the final week of the school Together these notes provide a panoramic state of the art view of probability theory areas related to statistical physics disordered systems and combinatorics Like the lectures themselves they are oriented towards advanced students and postdocs but experts should also find much of interest
