Rapid growth in water requirements makes it necessary to increase the amount of water drawn from rivers The dams necessary for capturing river water have to be built to resist damage when large floods occur and an idea of the possible destructive power of floods is given by the front photograph The need for protection results in thick sill structures fitted with gates and upstream and downstream cut off walls Sediment transported by rivers settles forming deposits behind dams where flow velocities decrease On the other hand where flow velocities are high through hydraulic machinery pumps and turbines fed from the dam it can be necessary to remove even fine sand from the water and also to remove floating debris Various hydro mechanical installations including gates and screens are introduced into the flow circuits to deal with sediment and debris problems Many empirical solutions to definition of very important details complement standard design procedures Understanding of their use is facilitated by numerous illustrations Structural Geology of Rocks and Regions George H. Davis, Stephen J. Reynolds, Charles F. Kluth, 2011-12-06 Relates the physical and geometric elegance of geologic structures within the Earth's crust and the ways in which these structures reflect the nature and origin of crystal deformation through time The main thrust is on applications in regional tectonics exploration geology active tectonics and geohydrology Techniques experiments and calculations are described in detail with the purpose of offering active participation and discovery through laboratory and field work *Bulletin*, 2001 Rock Engineering and Rock Mechanics: Structures in and on Rock Masses R.
