**Financial Mathematics, An (Fourth Edition)** J Robert Buchanan, 2022-10-25 Anyone with an interest in learning about the mathematical modeling of prices of financial derivatives such as bonds, futures and options can start with this book whereby the only mathematical prerequisite is multivariable calculus. The necessary theory of interest, statistical, stochastic and differential equations are developed in their respective chapters with the goal of making this introductory text as self contained as possible. In this edition the chapters on hedging portfolios and extensions of the Black-Scholes model have been expanded. The chapter on optimizing portfolios has been completely re-written to focus on the development of the Capital Asset Pricing Model. The binomial model due to Cox, Ross, Rubinstein has been enlarged into a standalone chapter illustrating the wide ranging utility of the binomial model for numerically estimating option prices. There is a completely new chapter on the pricing of exotic options. The appendix now features linear algebra with sufficient background material to support a more rigorous development of the Arbitrage Theorem. The new edition has more than doubled the number of exercises compared to the previous edition and now contains over 700 exercises. Thus students completing the book will gain a deeper understanding of the development of modern financial mathematics. **Probability, Markov Chains, Queues, and**

**Simulation** William J. Stewart, 2009-07-06 *Probability, Markov Chains, Queues, and Simulation* provides a modern and authoritative treatment of the mathematical processes that underlie performance modeling. The detailed explanations of mathematical derivations and numerous illustrative examples make this textbook readily accessible to graduate and advanced undergraduate students taking courses in which stochastic processes play a fundamental role. The textbook is relevant to a wide variety of fields including computer science, engineering, operations research, statistics and mathematics. The textbook looks at the fundamentals of probability theory from the basic concepts of set based probability through probability distributions to bounds, limit theorems and the laws of large numbers. Discrete and continuous time Markov chains are analyzed from a theoretical and computational point of view. Topics include the Chapman-Kolmogorov equations, irreducibility, the potential fundamental and reachability matrices, random walk problems, reversibility, renewal processes and the numerical computation of stationary and transient distributions. The  $M/M/1$  queue and its extensions to more general birth-death processes are analyzed in detail as are queues with phase type arrival and service processes. The  $M/G/1$  and  $G/M/1$  queues are solved using embedded Markov chains. The busy period, residual service time and priority scheduling are treated

Open and closed queueing networks are analyzed The final part of the book addresses the mathematical basis of simulation Each chapter of the textbook concludes with an extensive set of exercises An instructor's solution manual in which all exercises are completely worked out is also available to professors only Numerous examples illuminate the mathematical theories Carefully detailed explanations of mathematical derivations guarantee a valuable pedagogical approach Each chapter concludes with an extensive set of exercises
