**Damage and Failure of Rock Triggered by Dynamic Disturbance** Xu Chen, 2025-08-12 This open access book provides a detailed exploration of how dynamic disturbances such as those caused by blasting or seismic activity affect the damage and failure mechanisms of rocks When excavation is carried out under high stress environment the external disturbance will change the stress field of the rock which may lead to potential engineering damage such as large deformation and large displacement of the free surfaces of the engineering surrounding rock and even cause instability damage rockburst and other engineering disasters From 1960s onward the subject of progressive damage and failure of rock materials has been extensively investigated to prevent and control geological disasters and engineering accidents However the existing researches usually did not take the effects of low frequency dynamic disturbances on the mechanical properties of rock into consideration Rock mechanics researchers such as graduate students doctoral students or

academics need to understand the complex interactions between dynamic disturbances and rock integrity They require up to date knowledge of the latest research findings and models to predict rock behaviors accurately Applications of the Mathematical Sciences to Materials Science National Research Council (U.S.). manufacturing AM is one of the manufacturing processes that warrants the attention of industrialists researchers and scientists because of its ability to produce materials with a complex shape without theoretical restrictions and with added functionalities There are several advantages to employing additive manufacturing as the primary additive manufacturing process However there exist several challenges that need to be addressed systematically A couple such issues are alloy design and process development Traditionally alloys designed for conventional cast powder metallurgical processes were fabricated using advanced AM processes This is the wrong approach considering that the alloys should be coined based on the process characteristics and meta stable nature of the process Hence we must focus on alloy design and development for AM that suits the AM processes The AM processes however improve almost every day either in terms of processing capabilities or processing conditions Hence the processing part warrants a section that is devoted to these advancements and innovations Accordingly the present Special Issue book focuses on two aspects of alloy development and process innovations Here 45 articles are presented covering different AM processes including selective laser melting electron beam melting laser cladding direct metal laser sintering ultrasonic consolidation wire arc additive manufacturing and hybrid manufacturing I believe that this Special Issue bears is vital to the field of AM and will be a valuable addition **External**
