Rapid and Nondestructive Detection Techniques for Agri-Product Quality Te Ma, Xi Tian, Qiang Lyu, Lie Deng, 2024-08-13. Agri-product such as grains, fruits, and vegetables play a very important role in people's daily life. The agri-product quality directly affects human life and health. Agri-product quality refers to the quality characteristics acceptable to consumers, which mainly includes external factors such as size, shape, color, defect, and texture, and internal factors such as physical properties, chemical composition, and tissue diseases. Generally speaking, variety, climate, soil, cultivation techniques, diseases, and pests are all factors that affect the agri-product quality. Traditional methods for agri-product quality evaluation are time-consuming, complex, and expensive. With the continuous development of modern science and technology, rapid and nondestructive detection technologies are applied to evaluate the quality of agri-product. These technologies could obtain the optical, acoustics, and electrical properties of a specific substance and then reveal the appearance and internal quality of the agri-product. Furthermore, the trend today is that consumers have become more exigent for information about the products they purchase, which makes the nondestructive detection technology have more important application value in the field of agri-product quality evaluation.

Optical Remote Sensing of Ocean Hydrodynamics Victor Raizer, 2019-03-04. Optical Remote Sensing is one of the main technologies used in sea surface monitoring. Optical Remote Sensing of Ocean Hydrodynamics investigates and demonstrates capabilities of optical remote sensing technology for enhanced observations and detection of ocean environments. It provides extensive knowledge of physical principles and capabilities of optical observations of the oceans at high spatial resolution (1-4 m) and on the observations of surface wave hydrodynamic processes. It also describes the implementation of spectral, statistical, and fusion algorithms for analyses of multispectral optical databases and establishes physics-based criteria for detection of complex wave phenomena and hydrodynamic disturbances, including assessment and management of optical databases. This book explains the physical principles of high-resolution optical imagery of the ocean surface, discusses for the first time the capabilities of observing hydrodynamic processes and events, and emphasizes the integration of optical measurements and enhanced data analysis.
