Making gives planning students an understanding of research and methods of analysis that apply to comprehensive planning. Its informative text and examples will help students develop familiarity with various data sources and acquire the knowledge and ability to conduct basic planning analyses such as population projections, housing needs assessments, development impact analyses, and land use plans. Students will also learn how to implement the various citizen participation methods used by planners and develop an appreciation of the values and roles of practicing planners. In this revised second edition, Edward Jepson and Jerry Weitz bring their extensive experience as practicing planners and teaching faculty to give planning students the practical hands-on tools they need to create and implement real plans and policies. With an entirely new census data set, expanded discussions of sustainability and other topics, as well as new online resources including a companion website, the book is now more accessible and more informative, and its updated chapters on transportation, housing, environment, economic development, and other core planning elements also make it a handy reference for planning practitioners. Reliability and Life-Cycle Analysis of Deteriorating Systems Mauricio Sánchez-Silva, Georgia-Ann Klutke, 2015-11-27. This book compiles and critically discusses modern engineering system degradation models and their impact on engineering decisions. In particular, the authors focus on modeling the uncertain nature of degradation, considering both conceptual discussions and formal mathematical formulations. It also describes the basic concepts and the various modeling aspects of life cycle analysis (LCA). It highlights the role of degradation in LCA and defines optimum design and operation parameters. Given the relationship between operational decisions and the performance of the system's condition over time, maintenance models are also discussed. The concepts and models presented have applications in a large variety of engineering fields such as Civil, Environmental, Industrial, Electrical, and Mechanical engineering. However, special emphasis is given to problems

related to large infrastructure systems The book is intended to be used both as a reference resource for researchers and practitioners and as an academic text for courses related to risk and reliability infrastructure performance modeling and life cycle assessment
