

LABORATORY EXERCISE #3. Detection of genetically modified food products by gel electrophoresis

Introduction

PCR products of differing lengths can be separated from each other based on size by an analytical method called gel electrophoresis. In this method charged macromolecules (such as DNA, RNA or proteins) migrate through a porous gel typically made from agarose (polysaccharide polymer derived from sea weed) or polyacrylamide when an electrical current is applied. The DNA sample is loaded into a well within the gel and placed near the anode (negative charge). As DNA has a very high negative charge due to the presence of the ionized phosphate groups on its backbone, it will migrate away from the negative anode toward the positively charged cathode as electrophoresis takes place. During the migration, smaller DNA fragments will pass through the gel pores more easily and thus migrate through the gel faster. Larger DNA molecules take longer to get through the pores and will migrate slower. The separated DNA "bands" or fragments can be visualized within the gel by staining with **ethidium bromide**. This dye intercalates (inserts) itself into the DNA and will fluoresces under ultraviolet light. In other words, DNA fragments will appear as fluorescent bands in the gel when exposed to UV light (Fig 1).

Concept check: If you compared two DNA fragments, one of 200-base pairs (bp) and the other of 1000 bp, which fragment will appear lower on the gel/have migrated faster?

Q: During gel electrophoresis, DNA is separated based on what two properties?

A: Size and charge

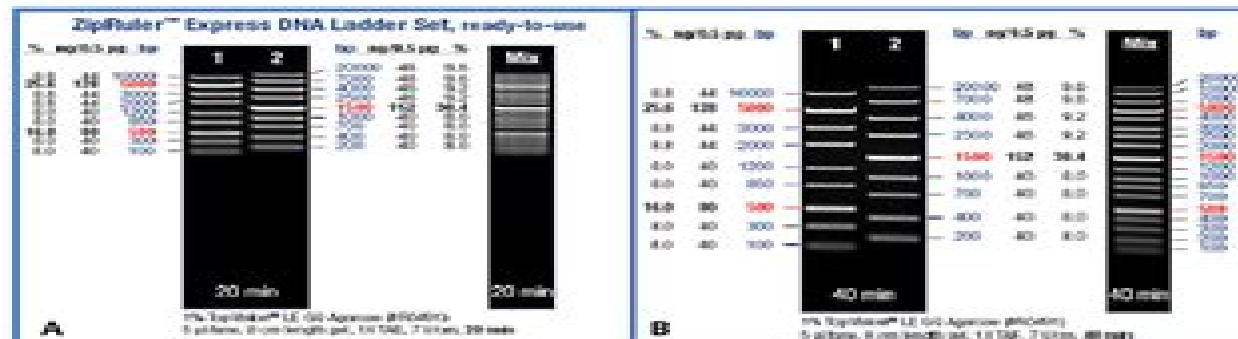

Figure 1. DNA fragments of known size are separated on an agarose gel for 20 min (A) or 40 min (B). By comparing the results, you can see how at 20 min, the DNA fragments are not well separated but by 40 min, the individually sized fragments are well separated and the size is easily determined. know and what we should know about American food production and its effect on health and the environment We don't think much about how food gets to our tables or what had to happen to fill our supermarket's produce section with perfectly round red tomatoes and its meat counter with slabs of beautifully marbled steak We don't realize that the meat in one fast food hamburger may come from a thousand different cattle raised in five different countries In fact most of us have a fairly abstract understanding of what happens on a farm In America's Food Harvey Blatt gives us the specifics He tells us for example that a third of the fruits and vegetables grown are discarded for purely aesthetic reasons that the artificial fertilizers used to enrich our depleted soil contain poisonous heavy metals that chickens who stand all day on wire in cages choose feed with pain killing drugs over feed without them and that the average American eats his or her body weight in food additives

each year Blatt also asks us to think about the consequences of eating food so far removed from agriculture why unhealthy food is cheap why there is an International Federation of Competitive Eating what we don't want to know about how animals raised for meat live die and are butchered whether people are even designed to be carnivorous and why there is hunger when food production has increased so dramatically America's Food describes the production of all types of food in the United States and the environmental and health problems associated with each After taking us on a tour of the American food system not only the basic food groups but soil grain farming organic food genetically modified food food processing and diet Blatt reminds us that we aren't powerless Once we know the facts about food in America we can change things by the choices we make as consumers as voters and as ethical human beings
