Holt Physics Characteristics Of Light:

Relativity for Scientists and Engineers Ray Skinner, 2014-06-18 An ideal choice for undergraduate students of science and engineering this book presents a thorough exploration of the basic concepts of relativity The treatment provides more than the typical coverage of introductory texts and it offers maximum flexibility since many sections may be used independently in altered order or omitted altogether Numerous problems most with hints and answers make this volume ideal for supplementary reading and self study Nearly 300 diagrams illuminate the three part treatment which examines special relativity in terms of kinematics and introductory dynamics as well as general relativity Specific topics include the speed of light the relative character of simultaneity the Lorentz transformation the conservation of momentum and energy nuclei and fundamental particles the principle of equivalence and curved space time Einstein's equations and many other topics

One-Dimensional Metals Siegmund Roth, David Carroll, 2015-07-21 Low dimensional solids are of fundamental interest in materials science due to their anisotropic properties Written not only for experts in the field this book explains the important concepts behind their physics and surveys the most interesting one dimensional systems and discusses their present and emerging applications in molecular scale electronics Chemists polymer and materials scientists as well as students will find this book a very readable introduction to the solid state physics of electronic materials In this completely revised and expanded third edition the authors also cover graphene as one of the most important research topics in the field of low dimensional materials for electronic applications In addition the topics of nanotubes and nanoribbons are widely enlarged to reflect the research advances of the last years *UCLA Summer Sessions* University of California, Los Angeles, 1918

Optoelectronic Properties of Organic Semiconductors Nasim Zarrabi, 2022-02-26 This book focuses on organic semiconductors with particular attention paid to their use as photovoltaic devices It addresses a fundamental and hitherto overlooked concept in the field of organic optoelectronics namely the role that sub gap states play in the performance of organic semiconducting devices From a technological point of view organic semiconductor based devices are of significant interest due to their lightweight ease of processability conformal flexibility and potentially low cost and low embodied energy production Motivated by these rather unique selling points the performance of organic semiconductors has been a subject of multidisciplinary study for more than 60 years with steady progress in applications such as solar cells transistors light emitting diodes and various sensors The book begins with a review of the main electro optical phenomena in organic solar cells and presents a new method for measuring exciton diffusion lengths based on a low quencher content device structure Furthermore the book reveals how mid gap trap states are a universal feature in organic semiconductor donor acceptor blends unexpectedly contributing to charge generation and recombination and having profound impact on the thermodynamic limit of organic photovoltaic devices Featuring cutting edge experimental observations supported with robust and novel theoretical arguments this book delivers important new insight as to the underlying dynamics of exciton generation
