Monoclonal Antibodies Philip Shepherd, Christopher J. Dean, 2000 Monoclonal Antibodies A Practical Approach covers the preparation testing derivation and applications of monoclonal antibodies New immunological techniques incorporating tried and tested methodologies are described making the book of interest to established and inexperienced immunologists Both the standard somatic hybridization technique and recombinant techniques including the use of phage libraries for the preparation of rodent and human monoclonal antibodies are described Protocols for both the small and large scale production are detailed as well as purification and labelling with both radioisotopes and non radioisotopes methods The applications of monoclonal antibodies in immunoblotting enzyme linked immunoassays immunofluorescence and FACS analysis are all covered in detail Finally protocols are given for the use of monoclonal antibodies in rheumatoid arthritis tissue typing detecting DNA modified during chemotherapy and in the clinical analysis of transplantation samples for malignancy This book will therefore be an invaluable laboratory companion to anyone using monoclonal antibodies in their research

Histocompatibility Testing Philip Dyer, Derek Middleton, 1993 Successful transplantation depends on the minimization of immunological differences between the donor and recipient tissues These differences are based on polymorphisms of the human major histocompatibility complex and play a major role in determining the acceptance or rejection of allografts during transplantation Histocompatibility Testing A Practical Approach describes methods for the investigation of these polymorphisms at the gene and protein levels and their application to the clinical transplanation of human organs and bone marrow There is currently no other text available covering these up to date serological and molecular techniques in this area of immunogenetics despite their importance to fundamental research clinical practice and forensic medicine This book will therefore be of great interest to researchers in many subject areas irrespective of whether they are in established laboratories or are entering this field for the first time

Histocompatibility Testing Jeffrey L Bidwell, Cristina Navarrete, 2000-03-08 This invaluable book provides comprehensive coverage of contemporary serological cellular and molecular methodologies in histocompatibility testing and their application to human organ transplantation and transfusion The contributors are internationally respected authorities in histocompatibility and immunogenetics and are closely involved in the development or application of state of the art technologies The first three sections of the book are primarily intended for use as a bench manual for histocompatibility testers immunologists and immunogeneticists the fourth and fifth sections on selection of donors and statistical methods will further assist medical practitioners involved in clinical transplantation and its outcome The final section of the book reviews the genetics and clinical relevance of minor

MHC Protocols Stephen H. Powis, Robert W. Vaughan, 2008-02-05 The aim of MHC Protocols is to document protocols that can be used for the analysis of genetic variation within the human major histocompatibility complex MHC HLA region The human MHC encompasses approximately 4 million base pairs on the short arm of chromosome 6 at cytogenetic location 6p21.3 The region is divided into three subregions The telomeric class I region contains the genes that encode the HLA class I molecules HLA A B and C The centromeric class II region contains the genes encoding the HLA class II molecules HLA DR DQ and DP In between is the class III region originally identified because it contains genes encoding components of the complement pathway The entire human MHC has recently been sequenced 1 and each subregion is now known to contain many other genes a number of which have immunological functions The study of polymorphism within the MHC is well established because the region contains the highly polymorphic HLA genes HLA polymorphism has been used extensively in solid organ and bone marrow transplantation to match donors and recipients As a result large numbers of HLA alleles have been identified a process that has been further driven by recent interest in HLA gene diversity in ethnic populations The extreme genetic variation in HLA genes is believed to have been driven by the evolutionary response to infectious agents but relatively few studies have analyzed associations between HLA genetic variation and infectious disease which has been difficult to demonstrate
